

I have a proposal to change things radically:

How about we use the AI tech for the "greatest good", i.e. for the sake of human race?

How about we accept its outputs (whether it be copyright, patent etc.) as the results of joint progress and categorize them as public domain assets?

I wonder whether we have a shot at making this tech selfless and human-centered.

Would we be blocking innovation or creativity by doing that? I don't think so.

In such scenario, every human being on earth would be benefiting from a free pool of AI creativity and no harm would be done to anyone involved.

If we would like to keep the technology gap and its social implications around the globe, sure, we can just continue to protect the rights of the owners/shareholders of autonomous AI systems.

Just a thought...
