

Standing Committee on the Law of Patents

Thirty-Seventh Session
Geneva, November 3 to 7, 2025

ARTIFICIAL INTELLIGENCE (AI) AND INVENTORSHIP (UPDATE OF SCP/35/7)

Document prepared by the Secretariat

INTRODUCTION

1. At its thirty-fourth session, held in Geneva from September 26 to 30, 2022, the Standing Committee on the Law of Patents (SCP) decided that the Secretariat would produce a compilation on how jurisdictions around the world address the issue of artificial intelligence (AI) inventorship, through jurisprudence, legislation and practice to be updated on a regular basis, and present it at the thirty-fifth session of the SCP (see document SCP/34/8 paragraph 25).
2. In accordance with the above decision of the SCP, the Annex to this document contains the said compilation of information for the Committee's discussion at its thirty-fifth session, which was held in Geneva from October 16 to 20, 2023.
3. At the thirty-sixth session of the SCP, the Committee agreed that the Secretariat would update document SCP/35/7 by updating Section V: National/Regional Legal Frameworks Regarding the Concept of Inventorship and Section VI: The "DABUS" Case including information regarding new cases and decisions on AI as an inventor. Pursuant to that decision, this document updates Section V and VI of document SCP/35/7.
4. In preparing the compilation, the Secretariat relied on information provided by Member States and Regional Patent Offices, including national and regional legislative provisions and decisions rendered by intellectual property offices and courts, and consulted other publicly available sources for supplementary material. Two calls for inputs supported this work: the first

informed the background document presented to the thirty-fifth session (SCP/35/7)¹, and the second informed the present update to Sections V and VI of that document.²

5. This compilation contains the following sections:

- (i) Artificial Intelligence: A brief overview and underlying technology;
- (ii) Human-AI interaction in the invention process;
- (iii) History of inventorship;
- (iv) International legal framework relating to inventorship;
- (v) National/regional legal frameworks relating to inventorship;
- (vi) The “DABUS case”;
- (vii) Concept of inventorship in relation to AI inventions.

6. For the benefit of the readers of this update document, paragraphs (or additions within a paragraph) and footnotes which are new or have been amended shown in blue. To support accessibility for visually impaired users, these paragraphs are: 35 to 37, 39, 45, 47, 56, 57, 59, 60, 71, 75, 87, 96, 107, 112, 115, 122, 123, 126, 128, 130 to 133, 135 to 144, 156, 165, 168 to 170, 178, 183, 184, and 193 to 196 and the new or amended footnotes are: 2, 40, 41, 52, 53, 62, 63, 65, 66, 72, 82, 99, 100, 132, 153, 173, 179, 210 to 212, 214 to 219, 221 to 238, 259, 272, 276 to 278, 289, 290, 299, 300, and 317 to 320.

[Annex follows]

¹ Member States and Regional Patent Offices were invited, through Note C. 9141, dated December 7, 2022, to submit to the International Bureau any additional inputs for the preparation of a compilation on how jurisdictions around the world address artificial intelligence (AI) inventorship through jurisprudence, legislation and practice. The inputs received are available on the SCP electronic forum:

https://www.wipo.int/scp/en/meetings/session_35/comments_received.html.

² Member States and Regional Patent Offices were invited, through Note C. 9260, dated January 31, 2025, to submit to the International Bureau any additional inputs relating to Section V (National/Regional Legal Frameworks Regarding the Concept of Inventorship) and Section VI (The “DABUS” Case) of document SCP/35/7. The inputs received are available on the SCP electronic forum:

https://www.wipo.int/scp/en/meetings/session_37/comments_received.html.

I. ARTIFICIAL INTELLIGENCE: A BRIEF OVERVIEW AND UNDERLYING TECHNOLOGY

1. The definitions of Artificial Intelligence (AI) vary and there is no widely accepted definition.¹ For the purposes of this document, AI systems shall be understood as learning systems, i.e., machines that can learn and through this, become better at tasks, which are typically performed by humans.² AI systems are thus emulating human cognitive functions, albeit it is not entirely clear how the “intelligence” of such systems is measured.³

2. Machine learning is the dominant AI technique that can be described as a subfield of AI.⁴ It works by identifying patterns in training data and then applying the obtained knowledge to new data and improving their performance on specific tasks without being expressly programmed.⁵ Machine learning processes exist in different variations, depending on the data they build upon, and their task.⁶ Machine learning contains three stages:

(i) program a model architecture;

(ii) develop a model through the training process based on a training algorithm and training data sets;

(iii) the model is applied to new data to produce a specific output.

3. One type of such a machine learning model is artificial neural networks. When an architecture is composed of a higher number of layers of neurons connected by adjustable parameters (weights), it is called a deep neural network, capable of deep learning.⁷ Simply put, deep learning outputs emerge from training a computer with big data through a complex numerical optimization process and performing a task based on the statistical probability calculated from what it has learned. Document SCP/30/5⁸ illustrates how deep machine learning works.

4. The success of deep learning models is generally based on their ability to take advantage of voluminous training datasets and the increase of computational power. Limitations of deep learning models become apparent particularly where no or limited training data (e.g., processing rare human languages, drug discovery for rare diseases, etc.) is available or in domains with legal restrictions.

5. Typically, one differentiates between general (or strong) AI and narrow (or weak) AI. The narrow AI is trained and focused on performing specific tasks, while the general AI would have a self-aware consciousness having the ability to solve problems.⁹ Today, only narrow AI systems exist, but they are already showing successful functional applications in various fields,

such as banking (e.g., approval of loans), medical sciences (e.g., diagnostic of melanoma), transportation (e.g., autonomous driving) or generating texts.

6. More recently, generative AI models, which are machine learning models that are capable of “creating” new output data once trained, have attracted attention. Using large language models (LLMs), AI can be trained to learn not only individual words that form a sentence but also the correlation between these words, which allows a trained model to generate new content, such as texts and images. The generative models have also been used for designing new chemical compounds for, e.g., medicinal use (generative chemistry)¹⁰, as LLMs are not confined to the processing of human languages but any combination of symbols, context and meaning.

7. Although deep learning models are able to learn, it still requires human interaction. For example, AI-human interaction is required in the creation of the network architecture, the determination of the best parameters (number of neurons per layer, size of input, etc.), selection of the resulting classes, and decision on how to encode the input in numerical format and in particular, the creation and making available of the training data, as well as providing the prompts to the AI model.¹¹ In addition, it is humans who evaluate the AI outputs, based on what the humans wish to achieve.

II. HUMAN-AI INTERACTION IN THE INVENTION PROCESS

8. Humans have been using technological tools to create new inventions and advance technological development. However, in the process of innovation, from the Eureka moment to conceiving an idea and developing a concept towards an invention that has practical utility, humans have been dictating the process. Even if humans use technological tools that have evolved substantially over time – for example, from a hammer to computer programs – humans have been indisputably accepted as inventors of inventions.

9. However, with the rapid development of AI technology, a reflection about how this interaction between humans and AI tools could evolve, and whether AI would play a role that is beyond being a “tool” in the innovation process, has been taking place.

10. For the consideration of inventorship, the interaction between humans and AI may take place in different ways, at least in theory:

(i) Human-only invention: This is the classical case regarding inventorship. In accordance with the established principles of national law, either one or several humans may claim inventorship for the invention. Inventors working “horizontally” together and contributing to the invention may potentially be co-inventors, and thus may have the right to a patent jointly.

(ii) Human-invention, assisted by AI: The human may be assisted by the AI in the innovation process. This assistance can take place in different forms, such as the identification of the technical problem to be solved or the verification of a certain solution found. As the AI is not engaged in the actual process of “conceiving” the invention, there is no argument to be made for the AI being an inventor. AI, in this case, is merely a tool in the hands of a human inventor.¹² For example, a human wants to develop a new pharmaceutical drug to improve the current available treatments of cancer. For this purpose, the human asks a deep learning mechanism to collect all available data on drugs

¹⁰ <https://www.nature.com/articles/s42256-022-00451-1>.

¹¹ *Ibid.*

¹² See, for instance, the response from Finland to Note C. 9141, arguing “[...] we currently consider AI to be a tool of a human inventor, be that the person who operates the AI system, designs the algorithm, collects the input data for the system or performs another important steps for the software to function.”

including the pharmaceutical formulae in this field, and their side effects. Based on this data, the human continues the work and comes up with a new and inventive solution.

(iii) Joint human-AI-invention: The human and the AI would work together, and both substantially contribute to the conception of the invention, for example, development of a new pharmaceutical compound with less side effects. It describes an invention that was created jointly by a human and AI system.

(iv) AI-invention, assisted by human: This case describes the inverse of the aforementioned case (ii). While there is considerable assistance by a human, e.g., with regard to identifying a problem to be solved, the actual conception of the invention is done by an AI system. The degree of assistance given by a human could vary. In essence, the AI would conceive the invention, and the human takes part in tasks that would not substantially contribute to the inventive concept (e.g., carrying out routine experiments).

(v) AI-only invention: This case is the extreme version of the aforementioned case (iv) and the inverse of case (i). Completely autonomous AI systems, which would engage in an inventive process even without the initial start signal given by a human, are still inconceivable. Therefore, this case is – for the time being – merely of theoretical interest. In this case, an AI would act without any human assistance and carry out the mental act on its own.

11. In each scenario, according to the disclosure requirement under patent law, a patent application may or may not be required to disclose the AI system involved. For example, if the invention solves the problem by using the output data X from an AI model with input data Y, the AI system could be essential for making and using the invention. However, if an AI system created (or assisted to create) a new chemical compound, making and using that compound as *such* does not require the AI system.

12. In addition to the different levels of human-AI interactions, another element that may be highlighted is that multiple persons in different roles may be involved in the creation of inventions using AI. For example, different persons may be involved in identifying a technical problem to be solved, designing an AI algorithm, generating and selecting data for training the AI model, using the trained AI model to produce an output from a set of input data, and analyzing and verifying the output data *vis-à-vis* the problem to be solved. Depending on the scope of the claimed invention and how the AI is associated with the claimed invention, more than one person may be considered joint inventors.

13. As illustrated above, how humans and AI systems contribute to the creation of AI-related inventions may vary significantly. Therefore, it seems necessary to look into the fundamental question: what is the notion behind the term “inventor” and how it is determined? Seeking answers to such a question under current patent law may bring the debate beyond the question as to whether an AI system can be named an inventor or not. Therefore, this document also addresses pertinent issues relating to inventorship under patent law, although it is not intended to be an exhaustive guide on inventorship.

14. It should be noted that, in relation to inventorship and AI, there are two distinct questions: (i) how the rules on inventorship are applied to AI inventions under the current patent law (*de lege lata*); and (ii) what rules on inventorship should be applied to AI inventions in the future under patent law (*de lege ferenda*). Whereas the former is a pure factual legal inquiry, the latter involves policy analysis and choices that may, or may not, require a legal reform in future. While both questions are equally important, this document focuses on the first question, as a baseline to be clarified before any further analysis and debate.

III. HISTORY OF INVENTORSHIP

15. Between the 14th and 16th century, monarchs in Europe were granting privileges in the form of letters patent for various activities, such as silk manufacturing, printing, making of playing cards¹³, or brewing. These privileges were granted for a wide variety of common arts, but also for inventions, or introducing inventions (in the sense of importing ideas from abroad) in the territory of the ruler¹⁴ and depended on the monarch's mercy, as strict rules for the granting of the letters patent were missing.¹⁵ Some of these privileges granted protection against imitation, others were exemptions from the strict regulations imposed by guilds.¹⁶

16. At that time, the idea of rewarding the person of the inventor was not unheard of. The promotion of the local economy in the monarch's territory and the generation of income for the crown were the driving factors behind the development of this letters patent system. Frequently, privileges were also simply granted to favorites of the courts and royal supports more generally.¹⁷ This development led to a situation that severely hampered commerce, as, for instance, the British Crown had granted patents of monopoly on salt, vinegar, or leather production. As a remedy, in 1623, the British Parliament enacted the Statute of Monopolies, which prohibited the granting of privileges by the Crown, with the exception of patents for the "first and true inventor" of a new manufacture. The particular section six of the statute reads:

"[...] any declaration before mentioned shall not extend to any letters patents and grants of privilege for the term of fourteen years, or under, hereafter to be made, of the sole working or making of any manner of new manufactures within this realm, to the true and first inventor and inventors of such manufactures, [...]"

17. The mentioning of the "first and true inventor", whose inventions are shielded from the prohibition of granting privileges and the abolishment of all monopolies, marks a historic change in focus, away from the monarch, towards the person who conceived the invention. As the Statute of Monopolies had a considerable influence on the development of other patent laws in Europe, its innovative idea to put the inventor front and center spread to multiple jurisdictions.

18. Thus, it is no wonder that this "shift in focus" towards the inventor is also found in the early French patent legislation. First, in 1789, France abolished the practice of granting privileges through letters patent. Subsequently, the *Société des inventions et des découvertes* (Society of Inventions and Discoveries) lobbied for the adoption of a patent law, similar to the English one. Particular weight in this respect was given to a report presented by Stanislas de Boufflers, arguing that inventions are inventors' products, which should be protected by virtue of natural rights.¹⁸ In 1791, a patent law was enacted in France. It put the inventor first, declaring the rights in their intellectual creations as essentially a human right. The first part of the preamble of the French Patent Act of 1792 reads:

¹³ The privilege for importing and selling playing cards in England was annulled by the Court of King's Bench in the case *Edward Darcy Esquire v Thomas Allin of London Haberdasher* (1602) 74 ER 1131.

“[...] considering that any new idea, whose manifestation or development can become useful to the society, belongs originally to the one who conceived it, & that it would be an attack on human rights in their essence, not to consider an industrial discovery as the property of its author”.¹⁹

19. Finally, the Constitution of the United States of America, in Article 1 Section 8, Clause 8, grants the Congress the power “to promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries”. According to this provision, inventors have exclusive rights for a certain purpose within society. While the French patent law emphasizes the natural right of the inventor (although usefulness of inventions for the society at large was acknowledged), the Constitution of the United States of America appears to focus on a utilitarian rationale, namely the “promotion of progress of science”. Though these approaches differ in detail, the reference point for the patent is in both cases the same: the inventor. The pivotal importance of the inventor becomes obvious in Madison’s explanation of the copyright and patent clause, stating that;

“The copyright of authors has been solemnly adjudged, in Great Britain, to be a right of common law. The right to useful inventions seems with equal reason to belong to the inventors. The public good fully coincides in both cases with the claims of individuals.”²⁰

20. In summary, the perception of patents has changed over a long period of time. The Statute of Monopolies no longer saw patents as a contract between monarchs and their subjugated citizens, but rather a “social contract” between the patentee and society that acknowledged the individual and its ingenuity.²¹ The idea that human ingenuity promotes progress of science and creation of useful inventions for society, for which natural law requires the granting of a reward in the form of an exclusive right to a specific person, rendered the inventor central to patent law. This approach became even more prominent in the decades to come, and was included in international debates on patent law, culminating at the Revision Conference for the Paris Convention for the Protection of Industrial Property, held in London in 1934. At that Conference, the “right to be mentioned in the patent” for the inventor was introduced and spurred substantial changes in national patent laws. For instance, German patent law switched from the applicant principle to the inventor principle, abolishing company inventions as such.

IV. INTERNATIONAL LEGAL FRAMEWORK RELATING TO INVENTORSHIP

A. PARIS CONVENTION FOR THE PROTECTION OF INDUSTRIAL PROPERTY

21. Article 4^{ter} of the Paris Convention for the Protection of Industrial Property (Paris Convention) states that “[t]he inventor shall have the right to be mentioned as such in the patent.” The provision was introduced at the Revision Conference of London in 1934 and established moral rights of the inventor, entailing the right of recognition. The provision, however, addresses neither an economic right nor economic benefits of inventors.²² The inventor may waive the right to be mentioned, unless national legislation prescribes otherwise.²³ The issue of inventorship as such and how exactly the moral rights of the inventor may be

¹⁹ French Patent Act of January 7, 1791, available at: <https://artflsrv03.uchicago.edu/philologic4/revlawall1119/navigate/12/59/>.

²² *Ibid*, para. 10:36.

²³ Georg H. C. Bodenhausen, *Guide to the Application of the Paris Convention for the Protection of Industrial Property*, 1968, p. 64.

exercised is a matter of national law, as the Paris Convention does not elaborate on these matters.

22. Historically, Article 4^{ter} of the Paris Convention builds on prior work done by the Consultative Committee on Intellectual Workers of the International Labour Organization (ILO), which also discussed rules regarding the rights of employee inventors.²⁴ In fact, the inclusion of moral rights of the inventor “to be mentioned in the patent” was advocated for by the Consultative Committee on Intellectual Workers of the ILO on the basis of an earlier resolution, adopted at an ILO meeting in Geneva in 1929, which generally called for the protection of employee inventions, including fair remuneration of employee inventors.²⁵ However, the issue of remuneration was considered to be too closely connected to the contractual arrangements between employer and employee to be part of the Paris Convention.²⁶ Therefore, in the absence of any consensus among delegations at the Revision Conference, a provision regarding the employee inventions was not incorporated into the Paris Convention. The moral rights provision, however, was adopted without opposition.²⁷

B. PATENT COOPERATION TREATY (PCT)

23. Pursuant to Article 1(2) of the Patent Cooperation Treaty (PCT), “[n]o provision of this Treaty shall be interpreted as diminishing the rights under the Paris Convention for the Protection of Industrial Property of any national or resident of any country party to that Convention”. In contrast to the Paris Convention, the PCT does not speak explicitly of a right of the inventor to be mentioned. However, since only the Contracting States of the Paris Convention may become a party to the PCT,²⁸ in effect, all PCT Contracting Parties shall comply with the Paris Convention, including Article 4^{ter} regarding the moral rights of inventors.

24. In the context of formality requirements relating to an international patent application, according to PCT Article 4(1)(v), the request, included in an international application, shall contain, *inter alia*,

“the name of and other prescribed data concerning the inventor where the national law of at least one of the designated States requires that these indications be furnished at the time of filing a national application. Otherwise, the said indications may be furnished either in the request or in separate notices addressed to each designated Office whose national law requires the furnishing of the said indications but allows that they be furnished at a time later than that of the filing of a national application.”

25. PCT Article 4(4) further stipulates that,

“[f]ailure to indicate in the request the name and other prescribed data concerning the inventor shall have no consequence in any designated State whose national law requires the furnishing of the said indications but allows that they be furnished at a time later than that of the filing of a national application. Failure to furnish the said indications in a separate notice shall have no consequence in any designated State whose national law does not require the furnishing of the said indications.”

26. As information regarding the inventor is typically required in the national phase, it is generally recommended that it is included in the request.²⁹ The formalities regarding the

²⁴ Record of the Revision Conference of London, Union Internationale pour la Protection de la Propriété Industrielle, Actes de la Conférence Réunie à Londres, 1934, p. 90-91.

²⁵ *Ibid.*, p. 160-161.

²⁶ *Ibid.*

²⁷ Sam Ricketson, *The Paris Convention for the Protection of Industrial Property: A Commentary* para. 10:35 (2015).

²⁸ PCT Article 62(1),

²⁹ Thomas Henninger, *Filing an international application*, in *PCT: Strategy and Practice*, p. 39 (Derk Visser et al. eds., 2021).

information of the inventor are further specified by the Regulations under the Patent Cooperation Treaty (PCT Regulations) and the Administrative Instructions under the Patent Cooperation Treaty (Administrative Instructions).

27. According to Rule 4.6 of the Regulations, the request shall, where Rule 4.1(a)(iv) or (c)(i) applies, indicate the name and address of the inventor, or, if there are several inventors, of each of them. With regard to the exact form of the name and address, names of natural persons shall be indicated by the person's family name and given name(s), the family name being indicated before the given name(s).³⁰ As to the addresses, they shall be indicated in such a way as to satisfy the customary requirements for prompt post delivery at the indicated address [...].³¹

28. Furthermore, the international application may contain certain declarations with respect to the identity of the inventor³², the applicant's entitlement to a patent³³ and the inventorship³⁴. These declarations enable the applicant to comply with some of the national requirements of the designated Offices referred to in Rule 51*bis*.1 already during the international phase. The declarations must be worded in accordance with Sections 211 and 214 of the Administrative Instructions, respectively. The declaration of inventorship, for the purposes of designation of the United States of America (and also India, Liberia and Mongolia), contains the name, residence and mailing address of the inventor(s), and must be signed by the inventors themselves, i.e., a signature of the patent agent is not sufficient.

C. PATENT LAW TREATY (PLT)

29. Article 6(1) of the PLT states that, in principle, no Contracting Party shall require compliance with any requirement relating to the form or contents of an application different from or additional to the requirements relating to form or contents which are provided for in relation to the international applications under the PCT. In addition, PLT Article 6(2) provide that a Contracting Party may require that the information that corresponds to the contents of the request part of the international application be presented on a request form prescribed by that Contracting Party. Accordingly, the requirements relating to the form or contents of a PCT international application, including indication of inventors and relevant declarations, are incorporated by reference into the PLT.

D. AGREEMENT ON TRADE-RELATED ASPECTS OF INTELLECTUAL PROPERTY RIGHTS (TRIPS AGREEMENT)

30. The TRIPS Agreement itself does not contain a provision with regard to inventorship. It however incorporates Article 4^{ter} of the Paris Convention by means of reference in its Article 2.1, whereby the WTO members, whether they are party to the Paris Convention or not, are obliged to implement Articles 1 through 12, and 19 of the Paris Convention.³⁵

V. NATIONAL/REGIONAL LEGAL FRAMEWORKS REGARDING THE CONCEPT OF INVENTORSHIP

A. INVENTOR'S RIGHT TO A PATENT

31. Inventorship marks the point of origin of each invention. It belongs to the inventor(s) of the invention, and indicates, generally speaking, "who conceived the subject matter at issue"³⁶.

³⁰ Rule 4.4(a) of the PCT Regulations.

³¹ Rule 4.4(c) of the PCT Regulations.

³² Rule 4.17(i) of the PCT Regulations.

³³ Rule 4.17(ii) of the PCT Regulations.

³⁴ Rule 4.17(iv) of the PCT Regulations.

³⁵ See with regard to Article 6*quinquies*, Appellate Body Report *United States-Section 211 Omnibus Appropriations Act of 1998*, WT/DS176/AB/R, January 2, 2002, paras. 124, 125.

³⁶ Gladstone Mill III, Patent Law Fundamentals, Volume 5 § 17:3 (2d ed., 2022).

As explained in the section on the historical development of inventorship, the importance of the concept has evolved over time. It can be understood as an “inventor centric” approach in patent law, compared to the historic origins of patents as privileges granted by a monarch. In this sense, inventorship symbolizes the “personality dimension” of a patent (besides its “property component”).³⁷ It manifests itself in the right of the inventors to be, or (at their discretion) not to be, mentioned in a patent application or a patent as the inventor of a given invention.³⁸ This means that a specific (group of) person(s) is continually associated with the origin of the invention. Therefore, inventorship is a “static” concept, i.e., once established, it does not change over time. It focuses on identifying the person(s) behind the conception of the invention. Thus, it serves the purpose of assigning the inventor(s) a special position within the legal order, which comes with economic and moral rights.

32. Patent rights are defined as private rights, pursuant to the preamble of the TRIPS Agreement, which means that they can be claimed by private, natural or juridical, persons in the respective national law.³⁹ These private rights are associated with economic rights and the ownership of the patent. The concept of *ownership* of a patent differs strictly from the concept of *inventorship*, as ownership relates to the legal *possession* over the invention, whereas inventorship relates to the *originator* of the invention. Specifically, the patent owner enjoys exclusive rights, as stipulated in Article 28.1(a) and (b) of the TRIPS Agreement, such as the making, using or selling of the invention. Also, the patent owner can assign, or transfer by succession, the right to a third party or conclude licensing contracts (Article 28.2 of the TRIPS Agreement). In contrast to the “static” concept of inventorship that, once established, does not change, ownership is a “dynamic” concept and may vary over time.

33. Yet under modern patent law, the concepts of inventorship and ownership are closely related. National/regional patent laws often stipulate that, in principle, “the right to a patent shall belong to the inventor or his successor in title”.⁴⁰ In other words, in principle, once an invention is created, in the first place, it is an inventor of the invention who is entitled to claim the right to obtain a patent, and if obtained, to enjoy patent protection of the invention. An inventor may assign such a right to another person (i.e., a successor in title), who may be a natural person or a legal person. With the assignment, the right to a patent is transferred to the assignee.

34. A similar approach is chosen for instance, in Section 7(2) of the Patent Act 1977 of the United Kingdom where it is explicitly stipulated that “A patent for an invention may be (a) granted *primarily* to the inventor [...] (c) in any event, to the successor or successors in title [...]” (*emphasis added*). Likewise, Section 15(1) of the Australian Patent Act 1990 states that “Subject to this Act, a patent for an invention may only be granted to a person who: (a) is the inventor; or (b) would, on the grant of a patent for the invention, be entitled to have the patent assigned to the person; or (c) derives title to the invention from the inventor or a person mentioned in paragraph (b); or (d) is the legal representative of a deceased person mentioned in paragraph (a), (b) or (c).”

³⁷ See the response from the Czech Republic to Note C. 9141.

³⁸ *Ibid.*

³⁹ Carlos Correa, Trade Related Aspects of Intellectual Property Rights: A Commentary on the TRIPS Agreement, p. 42 (2020) (explaining that it is unclear why the negotiating parties included this statement in the preamble).

⁴⁰ See, for instance, Brazil (Article 6° of Law No. 9279), Colombia (Article 22 of Decision No. 486 of the Commission of the Andean Community), China (Article 6(2) of the Patent Law of the People’s Republic of China), Czech Republic (Section 8(1) of Act No. 527/1990), Finland (Section 1 of the Finnish Patent Act), Germany (Section 6(1) of the German Patent Act), Kenya (Section 30(1) Industrial Property Act), Republic of Korea (Article 33(1) of the Korean Patent Act), Portugal (Article 57 of the Industrial Property Code), Russian Federation (see response to C. Note 9141), Slovakia (Article 10(1) of Act No. 435/2001 Coll. On Patents, Supplementary Protection Certificates and on Amendment of Other Acts as Amended), Spain (Article 10 of the Patent Act); Article 60(1) of the European Patent Convention and Article 7(1) of the EAPC. Article 9(1) of the Bangui Agreement states that the right belongs to the inventor, while Article 61(1) of the Bangui Agreement refers to the successor in title.

35. In the Russian Federation the exclusive right to a result of intellectual activity created through creative work initially vests in its author (Article 1228(3) of the Civil Code). Pursuant to Article 1357(1) of the Civil Code, the right to obtain a patent for an invention initially belongs to its author. At the same time, such right may pass to another person (legal successor) or be transferred to such person in cases and on the grounds provided by law, including through universal succession or under a contract, including an employment contract (Article 1357(2) of the Civil Code).

36. Similarly, in the Republic of Moldova, Article 14(1) of Law No. 50-XVI on the Protection of Inventions (in force since 4 Oct 2008) provides that *“The right to a patent shall belong to the inventor or his successor in title.”* Article 14(2) adds a first-to-file tie-breaker: *“If two or more persons have made an invention independently of each other, the right to a patent shall belong to the person whose patent application has the earliest date of filing, provided that this first application has been published in accordance with Article 49”*. Together, the two paragraphs mirror the classic principle that the initial entitlement vests in the inventor but can pass to a successor.

37. In France, the industrial property right belongs to the inventor or their successor. If several persons have independently made the invention, the industrial property right belongs to the one who can demonstrate the earliest filing date.⁴¹

38. Exceptions from the general rule that the inventors own their inventions appear in several fields. Many national and regional laws provide a separate set of rules regarding the right to a patent where an invention is made within the employer-employee relationship and/or a creation of an invention is commissioned (see Section V.F. (Employee Inventions), below, for further details). In addition, specific rules may apply in the field of inventions made with the assistance of governments. For example, the provisions of 35 U.S.C. §§ 200–212, commonly referred to as the Bayh-Dole Act, govern patent rights for inventions made with federal assistance.⁴²

39. As an example, in the Russian Federation, special legal regimes apply where an invention is created by an employee in line of his/her employment duties, or when work is performed under a contract, or when work is carried out under a State or municipal contract (Articles 1370, 1371, and 1373 of the Civil Code).

Inventor’s oath or declaration

40. Some jurisdictions require that the inventor(s) submits a formal statement, declaring that he/she believes that he/she is the inventor (or the joint inventor) of the claimed invention contained in the patent application. For instance, Section 115(a) of Title 35 of the United States Code (35 U.S.C.) states that “[a]n application [...] shall include [...] the name of the inventor for any invention claimed in the application. Except as otherwise provided in this section, each individual who is the inventor or a joint inventor of a claimed invention in an application for patent shall execute an oath or declaration in connection with the application”, which shall be signed by the inventor (or the joint inventor) himself/herself.

Applicant’s entitlement to apply for and be granted a patent

41. As the inventor may assign his/her right to a patent to another person, if the inventor is not the applicant, many jurisdictions require the submission of a declaration or a document showing how the applicant has obtained the right: in other words, why the applicant is entitled to apply for and be granted a patent. The formality requirements that an applicant, who is not the inventor, must comply with vary among different jurisdictions. For example, under

⁴¹ See the response from France to Note C. 9260.

⁴² See with further details, Christian E. Mammen, 'United States of America', in Willem A. Hoyng and Frank W.E. Eijsvogels (eds), *Global Patent Litigation*, Kluwer Law International; 2006, Online Update, March 2023, p 5-6.

Article 26(k) of Decision 486 of the Andean Community states that “the application for a patent shall be filed with the competent national office and shall contain the following: [...] (k) where applicable, a copy of the document attesting the assignment of the right to the patent by the inventor to the applicant or to his principal.” Accordingly, in Colombia, the applicant who is not the inventor must annex either a copy of the assignment contract or of the contract by virtue of which such assignment can be legally presumed.⁴³

42. Under Article 81 of the European Patent Convention (EPC), where the applicant is not the inventor nor the sole inventor, the designation of the inventor shall contain a statement indicating the origin of the right to the European patent. The designation shall be filed in a separate document and shall state the family name, given names and country and place of residence of the inventor, contain the statement referred to in EPC Article 81, and bear the signature of the applicant or his representative.⁴⁴ If the application does not fulfil the requirements pursuant to Article 81, the applicant will have the opportunity to correct the application within sixteen months from the date of filing or, if priority is claimed, the earliest priority date, and in any event no later than five weeks prior to the intended date of publication of the application.⁴⁵ Likewise, Rule 5(5)(e) of the Regulations for Implementing the Protocol on Patents and Industrial Designs within the Framework of the African Regional Intellectual Property Organization (Harare Regulations) stipulates that where the applicant is the inventor, a statement to that effect and, where he is not, the name and address of the inventor accompanied by a statement specifying the basis of the applicant's right to the patent shall be submitted.

43. Similarly, in the United States of America, an applicant, who is not the inventor needs to provide some proof of entitlement/assignment information, such as an employment contract.⁴⁶ It is also to be noted that 35 U.S.C. 261 requires transfer of ownership by an assignment to be in writing.⁴⁷ The position of inventors, and consequently their rights, are furthermore protected by certain remedies available in case of wrongful designation of the inventorship or wrongful taking of the invention (see Section V.G., below, for further details).

B. MORAL RIGHTS

44. In implementing Article 4^{ter} of the Paris Convention, national laws provide rules on the moral rights of inventors, i.e., the right to be mentioned in a patent. A transfer of moral rights is not possible under many laws.⁴⁸

45. In the Republic of Moldova, Article 17(5) of Law No. 50-XVI on the Protection of Inventions (in force since 4 Oct 2008) provides that “*the inventor shall have the right to be mentioned in the patent application, in the patent and in the AGEPI publications in respect of the application or the patent*”. Additionally, Article 17(6) provides that “*the inventor shall have the right to renounce the mention of his name in the patent application, in the patent and in the AGEPI publication in respect of the application or the patent, by filing a written request with the AGEPI.*”

46. In Spain, pursuant to Article 14 of the Spanish Patent Act, the inventor has, *vis-à-vis* the patent holder or applicant, the right to be mentioned as such in the patent.⁴⁹ Furthermore,

⁴³ See 1.2.2.2. of Chapter One, Title X of the Internal Circular of the Superintendence of Industry and Commerce.

⁴⁴ See European Patent Guide, 4.1.014, European Patent Office.

⁴⁵ See Article 90 (3)-(5) of the EPC and Rule 60.

⁴⁶ See USPTO, Patent Rules Appendix R, Manual of Patent Examining Procedure (July 2022), §1.46, § 1.76(7), see also the requirement for recording pursuant to §3.21, §3.24.

⁴⁷ See *Realvirt, LLC v. Lee*, 195 F.Supp.3d 847, 859 (E.D. Va. 2016).

⁴⁸ See for example, the response of Singapore to Note C. 9141 stating that according to case law, inventorship is interpreted as a personal right which is unique to the inventor and cannot be assigned the way proprietary interests can.

⁴⁹ See the response from Spain to Note C. 9141.

according to Section 63(1) of the Patent Act of Germany, the inventor is granted the right to be mentioned in the first publication of the application, the patent specification and the publication of the grant of the patent. Mentioning the inventor shall be recorded in the Register, unless the inventor requests not to be mentioned. The inventor may withdraw the request not to be mentioned at any time, in which event the inventor shall be subsequently mentioned in the applicable publication.⁵⁰ The inventor, however, may not permanently waive his/her right to be mentioned (i.e., the inventor's waiver of being mentioned shall be "without legal effect").⁵¹ The patent law in Kenya similarly stipulates, in Section 33 of the Industrial Property Act that "[t]he inventor shall be named as such in the patent application and in the patent unless within a special written declaration addressed to the Managing Director he indicates that he wishes not to be named and any promise or undertaking by the inventor made to any person to the effect that he will make such declaration shall be without legal effect."

47. Article 1356 of the Civil Code of the Russian Federation establishes that the right of authorship (i.e., the right to be recognized as the author of an invention⁵²) is inalienable and non-transferable, including in cases where the exclusive right to the invention is transferred to another party or when another party is granted the right to use the invention. Any waiver of this right is void. In case of inventions, the information about the author(s) must be included in the patent application (Article 1375(2) of the Civil Code) and in the patent itself, which, among other things, certifies the authorship of the invention (Article 1354(1) of the Civil Code). This information is also disclosed when publishing details about the patent application and the patent granted. At the same time, the author of the invention retains the right to decline being identified as such in publications related to the patent application or the issuance of the patent (Article 1385(1) and Article 1394(1) of the Civil Code).⁵³

48. Similarly, the right of the inventor to be mentioned in the Eurasian application and Eurasian patent is ensured under Article 14(viii) of the Eurasian Patent Convention (EAPC), and further specified in Rule 8 of the Patent Regulations to the EAPC, which allows the inventors to waive their rights to be mentioned before the technical preparations for publication of the Eurasian application or the Eurasian patent have been completed. This waiver may be withdrawn within the same time period.

49. According to Article 62 of the EPC, the inventor has the right to be mentioned as such before the European Patent Office (EPO). In addition, Rule 20(1) of the Implementing Regulations to the Convention on the Grant of European Patents (Regulations) states that the inventor shall "be mentioned in the published European patent application and the European patent specification, unless he informs the European Patent Office in writing that he has waived his right to be thus mentioned." Likewise, legal instruments of other regional organizations, such as the Andean Community⁵⁴, African Regional Intellectual property Organization (ARIPO)⁵⁵ and African Intellectual Property Organization (OAPI)⁵⁶, provide the right of the inventor to be mentioned as such in the publication of the patent application and patent, and also allow the inventor to withdraw such right.

⁵⁰ Section 63(1) of the German Patent Act.

⁵¹ *Ibid.*

⁵² The legislation of the Russian Federation exclusively uses the term "author of an invention". It does not use the term "inventor", even though the meanings of the two terms may overlap in general discourse. This distinction is codified in Article 1345 of the Civil Code of the Russian Federation, which defines the author as the natural person whose creative efforts resulted in the invention. See the response from the Russian Federation to Note C. 9260.

⁵³ See the response from the Russian Federation to Note C. 9260.

⁵⁴ Article 24 of Decision 486 of the Andean Community.

⁵⁵ Rule 20(2)(c) of the Harare Regulations. The Administrative Instructions on the Harare Protocol, in their Instruction 15, further elaborate that "the inventor shall be named as such in the patent [...] unless [...] he addresses to the Director General a special written declaration signed by him, indicating that he wishes not to be so named [...]".

⁵⁶ Articles 19(1)(d) and 35(1)(e) of the Bangui Agreement Instituting an African Intellectual Property Organization (Bangui Agreement).

50. Under Section 24(1) and (2) of the Singapore Patent Act, the inventor has the right to be mentioned as such in any patent granted for the invention and, the persons whom the applicant believes to be the inventor(s) must be identified in the patent application.⁵⁷

51. In Lithuania, a patent application and a patent must contain the “forenames and surnames” of the inventor or inventors (Article 12(1)).⁵⁸

C. “INVENTOR” = NATURAL PERSON?

52. Under patent law, protectable inventions need to meet the industrial applicability/utility requirement. Patentable inventions are often characterized as technical solutions to specific problems. Therefore, the notion of “inventions” under the patent law reflects humanity and societal needs. To that end, an inventor carries out a process that leads to an invention – recognizing a problem, searching for an answer and identifying a solution.

53. In some countries party to the Paris Convention, the term “inventor” is defined in a dedicated statutory provision of the applicable law,⁵⁹ while other jurisdictions explain the term in secondary legislation, e.g., explanatory/implementing rules for the patent law.⁶⁰ Some countries rely on case law or a contextual reading of the term “inventor” to interpret that term. Many of those jurisdictions that have certain guidance on the interpretation of the term “inventor” point out that an inventor has to be a natural person.

54. Facing the so-called DABUS applications, some national/regional patent offices and courts confronted the question as to whether an AI system can be an inventor under their patent laws. This question closely relates to the definition and interpretation of the term “inventor”. Therefore, the decisions of national patent offices and courts relating to the DABUS applications provide detailed legal analysis of this term. Therefore, an overview of these decisions from Australia, Brazil, Canada, Germany, India, New Zealand, the Republic of Korea, South Africa, the United Kingdom, the United States of America and the European Patent Office (EPO), compiled in Section VI.B., below, provides additional information on this topic.

Definition according to statutory provisions

55. In several jurisdictions, statutory provisions define inventors as “natural persons”. For instance, in Cuba, Article 6(2) of Decree-Law No. 290 defines the term “inventor” as “a natural person⁶¹ who has created an invention eligible for protection by a patent or registered utility model”. Similarly, pursuant to Article 2(8) of the Patent Law of Lithuania, an “inventor is a natural person who creates an invention”, or pursuant to Article 17(1) of Moldavian Law 50/2008 on the Protection of Inventions, the inventor is “the natural person whose creative work has led to the invention”.

56. In El Salvador, Article 3(45) of the Intellectual Property Act clarifies that an invention “*is understood to be any idea or creation of the human intellect that can be applied in industry, meets the conditions of patentability provided for in this Act and solves a specific technical problem*”. Likewise, in the Dominican Republic, Article 1 of the Industrial Property Act provides in part that: “*An invention is defined as any idea or creation of the human intellect capable of being applied in industry and that meets the conditions for patentability provided for in this Act*”.

⁵⁷ See the response from Singapore to Note C. 9141.

⁵⁸ See the response from Lithuania to Note C. 9141.

⁵⁹ These countries include, for instance, Cuba, Kenya, Lithuania, Moldova, the Russian Federation, Singapore, Slovakia, the United Kingdom, and the United States of America.

⁶⁰ See, for instance, the responses from Slovakia and China to Note C. 9141, referring to the “Explanatory Memorandum to the Patent Act (2001)” for excluding nonhuman entities from inventorship [Slovakia], and to Article 13 of the “Implementation Rules of the Patent Law” to define the term inventor [China], respectively.

⁶¹ Which means, according to the Cuban Civil Code, Law No. 59 any human being with the capacity to enjoy legal rights and be subject to legal obligations, see response from Cuba to Note C. 9141.

57. According to Article 7 (1) of the Hungarian Patent Act, 'Inventor' means a person who has created an invention. In the practice, 'a person' is interpreted exclusively to be a human being. Consequently, there is no option for designating an AI or any non-human entity as an inventor either, since only a natural person can be an inventor.⁶²

58. Article 1347 of the Russian Civil Code defines the "author of an invention" as "the citizen whose creative work created the corresponding result of intellectual activity".

59. Similarly, in Brazil, according to Article 6° of the Industrial Property Law (Law No. 9279, May 14, 1996), the right to obtain a patent shall be assured to the author of an invention.⁶³ With a view to Article 11 of the Copyright Law (Law No. 9610, February 19, 1998), which states that "[t]he author of a literary, artistic or scientific work is the natural person who created it", the inventor is considered as a natural person in Brazil.⁶⁴ However, in Brazil the authorship of patents by AI has been the target of legislative proposals (though none of these proposals have been enacted yet). Bill No. 303, of 2024 (Bill 303/2024), authored by Deputy Júnior Mano (PL-CE), proposes amending Art. 6 of Law No. 9,279, of 1996 (IP Law), to provide for the ownership of inventions generated autonomously by artificial intelligence systems. The Bill defines that "In the case of inventions generated autonomously by an artificial intelligence system, the patent may be applied for in the name of the artificial intelligence system that created the invention, which shall be considered the inventor and holder of the rights inherent to the invention".⁶⁵

60. The Rapporteur of the Science, Technology and Innovation Commission of the Brazilian Congress, congressman Leonardo Gadelha, proposed modifications to Bill 303/2024, presented in the form of a substitute text. The Substitute Text of Bill 303/2024 presents four highlights: (i) in cases where an invention or utility model is developed with the partial or full assistance of AI systems, patent ownership will be conferred on the human author (Art. 6 of IP Law), (ii) the patent term depends on the level of the assistance provided by artificial intelligence (Art. 40 of IP Law), (iii) the applicant must disclose the use of artificial intelligence systems in the development of the invention or utility model, classifying the level of assistance provided by AI systems into categories: absent assistance, partial assistance, predominant assistance, or fully autonomous, as regulated (Art. 19 of IP Law) and; (iv) the examination report issued by INPI must also address the classification of the level of assistance provided by AI systems (Art. 35 of IP Law).⁶⁶

61. In Rule 13 of the Implementing Regulations of the Chinese Patent Law, an inventor is defined as any person who makes creative contributions to the substantive features of an invention-creation. Similarly, in Slovakia, an Explanatory Memorandum provides guidance as to who is capable of innovation and consequently, what defines inventorship. The Explanatory Memorandum to the Patent Act (2001) notes that only natural persons can be inventors, since only natural persons are capable of cogitation, creative cogitation, which is the basic precondition of creation of any invention.⁶⁷

Definition by case law

62. For the United Kingdom, the inventor is defined in section 7(3) of the Patent Act as "the actual deviser of the invention". Independently of the DABUS case, according to case law, the

⁶² See the response from Hungary to Note C. 9260.

⁶³ In Brazil, the term "author of an invention" is synonymous with "inventor".

⁶⁴ See the response from Brazil to Note C. 9141.

⁶⁵ See the response from Brazil to Note C. 9260.

⁶⁶ *Ibid.*

⁶⁷ See the response from Slovakia to Note C. 9141.

understanding of the word “actual” denotes a contrast with a deemed or pretended deviser of the invention; it means, the natural person who “came up with the inventive concept.”⁶⁸

63. Section 2(1) of the Singapore Patent Act of 1994 stipulates that the “‘inventor’, in relation to an invention, means the actual deviser of the invention and ‘joint inventor’ is to be construed accordingly.” Courts interpreted the term “actual deviser” to mean “the natural person who came up with the inventive concept.”⁶⁹ The Singaporean courts further interpreted that inventorship is a personal right which is unique to the inventor and cannot be assigned the way proprietary interests can.⁷⁰

64. Section 1 of the Finnish Patent Act of 1967 states “[w]hoever has, in any field of technology, made an invention [...] or his or her successor in title, shall be entitled on application to a patent and thereby to the exclusive right to professionally exploit the invention in accordance with this Act”. According to the well-established jurisprudence, the word “whoever” means a natural person and thus a human being.⁷¹

Definition according to contextual reading

65. Some jurisdictions rely on a contextual reading of the term “inventor” to come to the conclusion that an inventor is a natural person.⁷² Specifically, beyond the policy justification of the patent system, the legislative provisions regarding the inventor’s moral rights, the right to a patent being originated by the inventor, assignment of the right to a patent from the inventor to a successor in title as well as the requirement to indicate the name of the inventor in a patent application (in the form of a given name and a surname) are often considered as important clues that lead to such an interpretation.

66. For example, in Spain, it is established that the term “inventor” refers to a natural person by reading together with the provision stating that “the right to the patent belongs to the inventor or his or her successors in title.”⁷³ As only humans have a successor, it is implied that inventors need to be necessarily humans.⁷⁴ In addition, the same interpretation can be drawn from Rule 2 of the Implementing Regulations of the Spanish Patent Act, which requires the indication of a name and surname of an inventor for the designation of the inventor.⁷⁵ Likewise, the Portuguese patent law acknowledges only a natural person as inventor, since the “name” and “residence” that shall be indicated in the patent application are interpreted to mean the name and residence of a natural person, and the entitlement to a patent by an inventor and his/her successor in title is only legally possible with regard to natural persons.⁷⁶

67. In the same line, Articles 36(1) and 184-5(1) of the Patent Act of Japan stipulate that the “*shimei*” of the inventor, and the “*shimei*” or “*meisho*” of the applicant must be submitted in a written application to the Commissioner of the Japan Patent Office. In that context “*shimei*” is understood as a surname and a first name of a natural person, whereas “*meisho*” is interpreted as the name of a juridical person.⁷⁷ As only the term “*shimei*” is used in connection with the inventor, it may be inferred that the inventor has to be a natural person. This contextual reading is further consistent with Article 29(1) of the Japanese Patent Act (“A person that invents an

⁶⁸ See House of Lords, *Yeda Research and Development Company Limited (Appellants) v. Rhone-Poulenc Rorer International Holdings Inc and others* [2007] UKHL 43 (decision of October 24, 2007), para. 20 with further references.

⁶⁹ *Energenics Pte Ltd v Musse Singapore Pte Ltd* [2013] SGHCR 21, see response from Singapore to Note C. 9141.

⁷⁰ *Ibid.*

⁷¹ See the response from Finland to Note C. 9141.

⁷² For example, the Philippines, see the response from the Philippines to Note C. 9260.

⁷³ Article 10 of the Spanish Patent Act.

⁷⁴ See the response from Spain to Note C. 9141; a similar idea was mentioned in the response from the Czech Republic to Note C. 9141.

⁷⁵ *Ibid.*

⁷⁶ See the response from Portugal to Note C. 9141.

⁷⁷ See the response from Japan to Note C. 9141.

invention with industrial applicability may obtain a patent for that invention [...]”), the possibility of transferring the right to a patent (Article 33(1)), and the requirements regarding succession of the right (Article 34(1)).⁷⁸ It is thus not permitted to indicate other entities than natural persons as the inventor in patent applications in Japan.⁷⁹

68. Similar to the above countries, only natural persons are accepted as inventors under the patent law of the Republic of Korea, since a patent application must contain the name and the domicile of an inventor, pursuant to Article 42 of its Patent Act.⁸⁰

69. In India, while its patent law does not define the term “inventor”, Section 2 of the Indian Patent Act, 1970 stipulates that the “true and first inventor does not include either the first importer of an invention into India, or a person to whom an invention is first communicated from outside India.” Since that provision only negatively describes who is not a “true and first inventor”, whether the “true and first inventor” has to be a person or not cannot be ascertained. Section 6 of the Indian Patent Act, however, states that any *person* claiming to be the true and first inventor of the invention can make an application for a patent (emphasis added). Furthermore, Section 7(3) of the Indian Patent Act makes it clear that only a person is seen as an inventor, as the provision stipulates that “Every application [...] shall name the person claiming to be the true and first inventor;”.

70. Norwegian patent law in Section 1 of the Patent Act, establishes that “[w]ithin any technical field, any person who has made an invention which is susceptible of industrial application, or his successor in title, shall, in accordance with this Act, have the right on application to be granted a patent for the invention [...]”. The wording “any person” is understood to refer to a natural person, not a juridical person.⁸¹ This follows from interpretation of the provisions based on a natural understanding of the wording and legal sources.

71. [In Syria, patent applications that include inventions generated by AI systems as the “inventor” pose many challenges and are incompatible with current patent law, given that AI is neither a legal nor a natural person.](#)⁸²

D. DETERMINATION OF AN “INVENTOR”

72. Inventorship is established differently in each jurisdiction, but common themes exist. In general, an inventor makes a creative contribution to technological advancement, which results in an invention. For example, under Russian patent law, it is held that the result of intellectual activity appears due to the creative contribution of a human being.⁸³ Thus, the author of an invention is the citizen whose creative work created the corresponding result of intellectual activity (see Article 1347 of the Russian Civil Code).⁸⁴ Other jurisdictions follow comparable approaches by defining intellectual property as “creations of the human mind/intellect, which then prescribes human ownership and inventorship.”⁸⁵

⁷⁸ *Ibid.*

⁷⁹ *Ibid.*

⁸⁰ See the response from the Republic of Korea to Note C. 9141.

⁸¹ See the response from Norway to note C. 9141.

⁸² [See the response from Syria to note C.9260.](#)

⁸³ See the response from the Russian Federation to Note C. 9141.

⁸⁴ *Ibid.*

⁸⁵ See the response from Trinidad and Tobago to Note C. 9141.

73. In the United States of America, “conception” of an invention is understood as the true “touchstone of inventorship”,⁸⁶ or the “threshold question in determining inventorship”⁸⁷. According to established case law, a person must participate in the conception of the invention in order to qualify as an inventor.⁸⁸ The term “conception” is understood as a mental process and further defined as the “completion of the mental part of the invention”.⁸⁹ According to *Burroughs Wellcome Co. v. Barr Laboratories, Inc.*, it is the formation in the mind of the inventor, of a definite and permanent idea of the complete and operative invention, as it is hereafter to be applied in practice. Conception is complete only when the idea is so clearly defined in the inventor’s mind that only ordinary skill would be necessary to reduce the invention into practice, without undue extensive research or experimentation.⁹⁰ A person must have contributed to the conception of at least one claim to be considered an inventor.⁹¹

74. The reduction to practice of an invention is the manifestation of the invention. This can be achieved by an actual physical creation of the product, the running of the process, or the filing of the patent application on the claimed invention (known as “constructive reduction to practice”).⁹² For determining an inventor, reduction into practice is *per se* irrelevant, except where conception of the invention and reduction into practice happen simultaneously.⁹³ Thus, “the inventor may solicit the assistance of others when perfecting the invention without “losing” any patent rights”⁹⁴. In other words, “there is no requirement that the inventor be the one to reduce the invention to practice so long as the reduction to practice was done on his behalf”⁹⁵.

75. Another approach for establishing inventorship is found in the requirement of “creative activity” of the inventor, for instance, in the patent laws of China, the Czech Republic,⁹⁶ and Slovakia⁹⁷. Pursuant to Rule 14 of the Implementing Regulations of the Chinese Patent Law, an inventor is defined as any person who makes creative contributions to the substantive features of an invention-creation. The term “creative contribution” is not further defined, but according to some case law, it is related to innovative intellectual work carried out in relation to the aforementioned substantive feature.⁹⁸ According to the Patent Examination Guidelines, inventors are explicitly defined as individuals – entities, organizations **as well as the name of an AI** are not allowed to be named as inventors.⁹⁹ **Where the inventor filled in the request for a patent not in conformity with these provisions, the examiner shall issue a *Notification to Make Rectification*.** Furthermore, merely auxiliary activity regarding the invention, such as providing a

laboratory or somebody responsible for organizational work only, is not considered an inventor.¹⁰⁰

76. In some countries, an inventor is defined or interpreted as “an actual devisor of the invention” and his/her contribution to the “inventive concept” is an important consideration for the determination of inventorship.

77. For example, in the United Kingdom, an inventor is defined in section 7(3) of the Patents Act¹⁰¹ as the “actual devisor of the invention”. In *Henry Brothers (Magherafelt) Ltd v The Ministry of Defence and the Northern Ireland Office*,¹⁰² the Court of Appeal emphasized that a two-step approach was necessary to determine inventorship. One must first identify the inventive concept and then determine who devised that concept. In this regard, it was observed that in some cases, deciding upon inventorship by assessing the evidence adduced by the parties on these two steps can be quite complex, since the inventive concept is a relationship of discontinuity between the claimed invention and the prior art (inventors themselves will often not know exactly where it lies).¹⁰³

78. The notion of the inventive concept has been developed by the Intellectual Property Office of the United Kingdom (UKIPO) and UK courts through numerous cases. For example, the inventive concept may reside in more than an idea and may encompass the means of realization of that idea.¹⁰⁴ A person is not the inventor merely because he/she contributed to a claim. The contribution must be to the formulation of the inventive concept.¹⁰⁵

79. Where the invention consists of a combination of individually known elements, the inventor is a person who made the combination in substance, rather than a person who merely contributed to it.¹⁰⁶ Relatedly, the contribution to the inventive concept would need to be distinguished from providing the “equivalent of common general knowledge in the art”. In *Yeda Research and Development Co Ltd v Rhône-Poulenc Rorer International Holdings Inc. and others*,¹⁰⁷ the inventive concept was determined as the combination of certain monoclonal antibodies and anti-neoplastic drug, which produced synergistic effects for the treatment of cancer. While the scientist from the Respondent provided the monoclonal antibodies to the scientists of the Appellant during the research, the relevant practical work using these antibodies was devised and carried out by the latter scientists. Accordingly, the House of Lords hinted that the mere provision of the monoclonal antibodies was no more than providing the equivalent of common general knowledge, and did not contribute to the inventive concept.

80. In addition, it was held that more than a theoretical proposal is required to be an actual devisor of the invention. In this regard, Jacob LJ characterized *obiter dictum* the “actual devisor” as someone who has “turned what was ‘airy-fairy’ into that which is practical [...]”.¹⁰⁸

81. Similarly, in Australia, an “Inventor” has been held a “person who makes or devises the process or product”.¹⁰⁹ It is a person who materially contributes to the inventive concept that is discerned from the whole of the specification, including the claims.¹¹⁰ The courts have clarified

that the body of the specification should explain the inventive concept and the claims assist in understanding the concepts that give rise to the invention. Consequently, even if a patent application contains “one invention, it may be the subject of more than one inventive concept or inventive contribution”.¹¹¹ For instance, if the invention consists of a combination of elements. It may be that different persons contributed to that combination.¹¹²

82. Under German law, courts and jurisprudence have developed the principles of how to determine an inventor.¹¹³ According to the decision of the Federal Court of Justice¹¹⁴ *BGH-Steuervorrichtung*, an inventor develops the knowledge how a concrete technical problem can be solved with certain technical means and announces this knowledge (while maintaining a confidentiality excluding the public from this) in such a way that it can be used as an instruction for technical action.¹¹⁵ The “act of creating the invention”, requires a creative contribution to finding the solution to a technical problem, whereby this needs to be examined by considering the entire invention protected by the patent, including its genesis.¹¹⁶ Since this act entails an intellectual contribution, it is missing in cases where, for example, the contribution to the invention merely consists of providing funds or facilities for the invention.¹¹⁷ An invention is only complete if the teaching on which it is based, is technically executable, i.e., if the average person skilled in the art can work successfully according to the inventor’s specifications. The patent claim need not explain in detail how the skilled person should act according to the given teaching. If the person skilled in the art requires more detailed instructions, it is however necessary, but also sufficient, to reproduce these in the patent description.¹¹⁸

83. As to the determination of inventorship in Japan, in the absence of the legislative definition of the term “inventor”, the established theory is based on the definition of the term “invention”, i.e., “a highly developed creation of a technical idea utilizing natural laws”¹¹⁹. Since the technical idea of a patented invention must be determined on the basis of the claims, taking into account the description and drawings, it is generally accepted that the inventor must have actually contributed to the act of creation of the technical idea. In general, Japanese courts set two steps for the determination of an inventor: (i) identify the “distinctive part” of the invention (i.e., technical idea), which are those that overcome technical problems and produce the technical effects of the invention; and (ii) identify the activities of the alleged inventor in the process towards the “completion of the invention” and evaluate his/her substantive contribution to the distinctive part of the invention. The Supreme Court ruled that the invention is complete when the technical idea is concrete and objective to the extent that a person skilled in the art can repeatedly implement the idea, achieving the desired technical effect.¹²⁰ Consequently, persons who made their contributions after the completion of the invention are not inventors. If their contributions are towards the elements outside the “distinctive part”, they are not inventors either. From these principles, it follows that persons who made non-technical contributions, such as a person providing financial support or a mere supervisor¹²¹ are not inventors.

Similarly, if the contribution is something that can be provided by a person skilled in the art¹²² (such as carrying out routine work¹²³), it is not sufficient to be recognized as an inventor.

84. With respect to the “distinctive part” of the invention to which an inventor must make substantive contribution, the Japanese IP High Court has rendered several decisions in which it was defined as “the part of the configuration of the claimed invention that has not be found in any prior art”, which “serves as a basis of the means of solving a problem unique to the invention”. In other words, the distinctive part consists of elements that are distinguishable from the state of the art and essential to solve the technical problem unique to the invention.¹²⁴

85. In France, it is an established rule that the invention consists of the means capable of obtaining a result. Consequently, the inventor is the one who discovers the means. It follows from this understanding that posing a problem or indicating a goal to be achieved is not inventing, because it is not providing the solution.¹²⁵ Following this rule, for example, a person who expresses the desire for a result to be obtained, while leaving to others the task of finding the appropriate means to obtain it, is not an inventor.¹²⁶

86. A person is recognized as an inventor where he/she played an active or essential role at the stage of formalization, technical development and finalization of the invention or in the analysis of the problem to be solved and the technical solution to be provided¹²⁷. Conversely, where the work of the presumed inventor did not concern the subject matter of the patent application¹²⁸ or where the presumed inventor provided nothing else than general information on the objective of their work but not information containing an invention¹²⁹, this was not sufficient for them to qualify as an inventor. For instance, a person carrying out simple execution tasks may not qualify as an inventor.¹³⁰ Likewise, coordination of research work or setting out the results to be achieved was usually not sufficient for establishing inventorship either¹³¹.

87. Under the legislation of the Russian Federation, individuals who have not made a personal creative contribution to the creation of a result of intellectual activity (including an invention) shall not be recognized as authors. This exclusion applies to: (1) persons who provided only technical, consultative, organizational, or material assistance to the author; (2) those who merely facilitated the formalization of rights to such result or its use; (3) individuals who supervised the execution of the relevant work. This provision is codified in Article 1228(1) of the Civil Code of the Russian Federation.¹³²

E. ESTABLISHING JOINT INVENTORSHIP

88. Joint inventorship describes a special case of inventorship in which two or more persons have jointly made an invention. The establishment of joint inventorship and the ownership of the patent between joint inventors differs among jurisdictions. In general, the establishment of joint inventorship is guided by the considerations surrounding the determination of inventorship in general: who made what contribution to the invention. Nevertheless, defining joint

inventorship is generally considered very difficult. One court referred to it as “one of the muddiest concepts in the muddy metaphysics of patent law”.¹³³

89. Some jurisdictions provide definitions for the term joint inventors. For instance, by codifying the decision *Monsanto Co. v. Kamp* from 1967¹³⁴, the law of the United States of America describes first and foremost what kind of circumstances do not *prevent* joint inventorship but falls short of setting explicit requirements for it. 35 U.S.C. § 116(a) states that:

“When an invention is made by two or more persons jointly, they shall apply for patent jointly and each make the required oath, except as otherwise provided in this title. Inventors may apply for a patent jointly even though (1) they did not physically work together or at the same time, (2) each did not make the same type or amount of contribution, or (3) each did not make a contribution to the subject matter of every claim of the patent.”

90. The wording of 35 U.S.C § 116(a) indicates that some form of “working together” and “type of contribution” among the joint inventors is necessary. In *Monsanto Co. v. Kamp* the requirements are further clarified:

“To constitute a joint invention, it is necessary that each of the inventors work on the same subject matter and make some contribution to the inventive thought and to the final result. Each needs to perform but a part of the task if an invention emerges from all of the steps taken together. It is not necessary that the entire inventive concept should occur to each of the joint inventors, or that the two should physically work on the project together. One may take a step at one time, the other an approach at different times. One may do more of the experimental work while the other makes suggestions from time to time. The fact that each of the inventors plays a different role and that the contribution of one may not be as great as that of another does not detract from the fact that the invention is joint if each makes some original contribution, though partial, to the final solution of the problem.”¹³⁵

91. In *Kimberly-Clark v. Procter Gamble*, examples of joint behavior are outlined as a “collaboration or working under common direction, one inventor seeing a relevant report and building upon it or hearing another’s suggestion at a meeting” and it is clarified that “[i]ndividuals cannot be joint inventors if they are completely ignorant of what each other has done until years after their individual independent efforts.”¹³⁶ *PerSeptive Biosystems, Inc. v. Pharmacia Biotech, Inc* makes it clear that joint inventors must each contribute to the conception of the claimed subject matter,¹³⁷ and that a joint invention is the product of a collaboration between two or more persons working together to solve the problem addressed¹³⁸. Even if inventors each did not make a contribution to the subject matter of every claim of the patent, they may apply jointly for the patent – a contribution to one claim of the patent is enough.¹³⁹

¹³⁹ USPTO, Manual of Patent Examining Procedure (MPEP), 2109.01 Joint Inventorship [R-07.2022] with reference to *Ethicon Inc. v. United States Surgical Corp* “The contributor of any disclosed means of a means-plus-function claim element is a joint inventor as to that claim, unless one asserting sole inventorship can show that the contribution of that means was simply a reduction to practice of the sole inventor’s broader concept.” *Ethicon Inc. v. United States Surgical Corp.*,135 F.3d 1456, 1460-63, 45 USPQ2d 1545, 1548-1551 (Fed. Cir. 1998).

92. In Germany, case law developed the main principles that co-inventors are those who have made a creative contribution to the invention.¹⁴⁰ Already in *BGH-Biedermeiermanschetten*¹⁴¹ it is established that the standard for establishing co-inventorship covers the entire invention as described in the patent application, including the way in which it came about.¹⁴² Further, the Federal Court of Justice specified that it is mistaken to examine the individual features of the patent claim as to whether they are known *per se* in the prior art, and, if so, to exclude them from a creative contribution of a co-inventor.¹⁴³ This entails that the means of the contribution do not need to fulfill all patentability requirements.¹⁴⁴

93. Generally, anyone who has made a sufficiently significant contribution to the invention is considered a joint inventor.¹⁴⁵ Thus, mere assistance in making the invention, such as providing funds, a laboratory or the technical registration of values by means of measurement, does not constitute joint inventorship. Neither is it sufficient if the contribution to the invention does not influence the overall success.¹⁴⁶ Therefore, those who only contribute to the creation based on instructions of the inventor or third parties are not considered joint inventors.¹⁴⁷ However, the contribution of the co-inventor does not need to be inventive itself.¹⁴⁸

94. In France, according to case law¹⁴⁹, it is considered necessary to determine whether the person claiming the status of co-inventor has demonstrated, with regard to the claims of the filed patent, a creative contribution. For example, in one case, a person participated to the preparation of a bibliographic report concerning the prior art and a study aiming to determine the quantity, structure etc. of the metal used in the invention. The court held that the person did not carry out work that concerned the actual subject matter of the patent applications, and thus had not demonstrated a creativity that enabled him to claim the status of co-inventor.¹⁵⁰ Any person who played an active role within a team and intervened at the stage of formalization, technical development and finalization of the invention, was considered to be an inventor.¹⁵¹

95. In Japan, the key concepts for the determination of the inventorship as indicated above, such as the substantive “contribution to the distinctive part” of the invention with regard to the technical problem to be solved in view of the prior art, and the “completion of the invention” to the extent that a person skilled in the art can implement the technical idea, also apply to the determination of joint inventors. The IP High Court of Japan stated: “If one person conceives the technical means and is involved in the whole process of bringing it into completion, the person alone is the inventor. If more than one person is involved in the process, the inventor refers to a person who creatively contributed to a distinctive part of the invention during the process. If there is more than one such person, all of them are inventors, or joint inventors.”¹⁵²

96. In the Russian Federation, citizens who created an invention through joint creative work are recognized as co-authors (Article 1348(1) of the Civil Code of the Russian Federation).¹⁵³

Ownership among joint inventors

97. Joint inventorship and joint ownership are distinct concepts. Depending on whether and how the right to a patent has been transferred from each of the joint inventors to their legal successor, a patent may be “owned” by the joint inventors, by their legal successors, or by a combination of inventors and legal successors. Nevertheless, the issue of joint ownership is briefly covered in this Section in order to provide a backdrop to the scenario involving joint human-AI inventors. Developing rules for the co-ownership of patents is characterized by striking a fine balance between often fundamentally opposed economic interests of different individuals that jointly own a patent. In a way, the exploitation of the patent is worthwhile for each of the co-owners – yet at the same time, ideally, the individual exploitation of the patent by one co-owner should not adversely affect the other co-owners. In practice, the question is whether and how the joint inventors can (or cannot) exploit the invention, license the patent, or transfer their ownership of the patent independently from each other. For instance, a focus on the freedom of one co-owner alone, including the power to license the patent to third-parties, means that considerable power is given to a single individual, as a single co-owner has the ability “to immunize [other] persons from infringement liability unilaterally”.¹⁵⁴ The task is further complicated by the fact that in many jurisdictions the rules covering patent co-ownership were originally designed to govern *physical* property – not *intellectual* property.

98. Conversely, if the joint interest of the group is given priority, this might result in an underutilization of the co-owned patent because cooperation might fail due to conflicting private interest of the co-owners (collective action problem) and hold-up situations might arise.¹⁵⁵ In fact, these problems became very much apparent in some jurisdictions, for example in the United States of America in the wake of the decision *Pitts v. Hall*¹⁵⁶ in the middle of the 19th century. In that decision, the court established the principle that joint inventors are like tenants in common, thus owning the patent collectively. Courts later dismissed that approach because unanimous consent of all co-owners for using the patent created the practical risk of blocking the commercial exploitation of patents, thus diminishing their commercial value.

99. For these reasons, jurisdictions across the world have found different approaches to fine-tune co-ownership of patents according to their legal tradition and economic realities. They all have to manage the conflicting interests of co-owners on the use of the patented invention, licensing, transfer of ownership, and enforcement of the patent. Approaches oscillate, generally speaking, between positions that favor exploitation of the patents by the single co-owner and more cautious approaches that give the group of co-owners more control over the exploitation.

More focus on the interest of the group of co-owners

100. As to the assignment of a patent, jurisdictions such as France and the Republic of Korea either prohibit a joint owner from assigning his or her share without the consent of all the other joint owners¹⁵⁷ (Republic of Korea) or establishes a pre-emption right for the other co-owners¹⁵⁸ (France). Further, in France, the exploitation of the patent in its own business of one co-owner is subject to payment of fair compensation to the other co-owners who do not exploit the invention.¹⁵⁹

¹⁵⁵ Robert Merges & Lawrence Locke, *Co-ownership of Patents: A Comparative and Economic View*, 72 *J. Pat. & Trademark Off. Soc'y* 586 (1990) (explaining that a jurisdiction that requires compensation of a co-owner in case another co-owner exploits the patent may have the wrong incentives to actually work the patent because each co-owner might simply wait for the other to start working the patent and getting compensated by him).

¹⁵⁶ *Pitts v. Hall*, 19 Fed. Cas. 758 (C.C.N.D.N.Y 1854).

¹⁵⁷ Article 37(3) Patent Act of the Republic of Korea.

¹⁵⁸ Article L613-29 e) *Code de la propriété intellectuelle* (Intellectual Property Code).

¹⁵⁹ Article L613-29 a) *Code de la propriété intellectuelle* (Intellectual Property Code).

More focus on the individual owner

101. A jurisdiction with a focus on the freedom to exploit the patent by an individual co-owner is, for instance, the United States of America. According to 35 U.S.C. Section 261, patents have the attributes of personal property. Thus, courts have held that “in the context of joint inventorship, each co-inventor presumptively owns a *pro rata* undivided interest in the entire patent, no matter what their respective contribution.”¹⁶⁰

102. The rights of joint owners are stipulated in 35 U.S.C. Section 262. It provides that “[i]n absence of any agreement to the contrary, each of the joint owners of a patent may make, use, offer to sell, or sell the patented invention within the United States of America, or import the patented invention into the United States of America, without the consent of and without accounting to the other owners.” Thus, each co-owner may independently exploit the patent and does not need the consent of his or her co-owner. Furthermore, the co-owner, who uses the patent profitably, does not need to share the revenue with the co-owners of the patent. The patent law of the United States of America allows the co-owner of a patent to license the right to others without obligation to share royalties with the other co-owners.¹⁶¹ The co-owner may even grant an exclusive license to a third-party, which would prevent the granting co-owner from granting further licenses to others, but such an exclusive license would have no effect on the other co-owners of the patent, who may continue to exploit or grant others licenses under the patent.¹⁶²

Middle ground

103. Some jurisdictions can be in some regards considered as a middle-ground position. For instance, in cases of patent co-ownership, German law applies Section 741 of the German Civil Code, i.e., the so-called *Gemeinschaft nach Bruchteilen* (co-ownership by defined shares)¹⁶³ as a default, i.e., without differing contractual agreement. It allows the exploitation for the gain of each co-owner through the application of Section 743(2) of the German Civil Code as interpreted within the jurisprudence of the Federal Court of Justice.¹⁶⁴ In contrast to French law, under German law, if the patent is exploited for the gain of one co-owner, there is no general compensation entitlement for other co-owners. However, in some special cases such a compensation might be deemed justified.¹⁶⁵ Similar to the approach of the United States of America, a patent co-owner under German law may freely transfer his or her share of the right and there is, again in contrast to French law, no pre-emption right for the other co-owners. This is because the co-owners under Sections 741 and 747 of the German Civil Code have no contractual relationship among themselves and thus enjoy *a priori* a higher degree of freedom to operate compared to situations in a partnership¹⁶⁶ with joint assets.

104. This may change in case a partnership is created among the co-owners, in accordance with Section 705 *et seqq.* German Civil Code, for instance, in case a group of persons

¹⁶⁰ *Ethicon v. United States Surgical Corp.*, 135 F.3d 1456, 1465 (Fed. Cir. 1998).

¹⁶¹ *Schering Corp. v. Roussel-UCLAV SA*, 104 F.3d 341 (Fed. Cir. 1997)

¹⁶² Jorge Contreras, *Intellectual Property Licensing and Transactions: Theory and Practice*, p. 43 (2022).

¹⁶³ German law differentiates regarding ownership of property in its civil code between the so-called *Gemeinschaft nach Bruchteilen* (co-ownership by defined shares, Section 741 of the German Civil Code) and the so-called *Gesellschaft mit gesamthänderischer Bindung* (partnership with joint assets, Sections 701, 719 of the German Civil Code).

¹⁶⁴ *Bundesgerichtshof* (Federal Court of Justice), decision of March 22, 2005, X ZR 152/03 – *Gummielastische Masse II* (“each co-owner may use the patent, as long as there was no majority vote by the co-owner against it”).

¹⁶⁵ See the discussion in Peter Mes, *Patentgesetz, Gebrauchsmustergesetz*, Section 6 para. 27, (5th ed. 2020).

¹⁶⁶ In contrast to the default co-ownership approach known as “co-ownership by defined shares”, the model of “joint property” (sometimes called “ownership in common”) does not allow for independent transfer of shares of the invention because “joint property” constitutes a jointly hold asset, without any marketable shares. Each owner has thus a property right in the whole property.

deliberately decided to develop an invention jointly, based on a contractual agreement.¹⁶⁷ Further, a co-owner of a patent may not grant freely licenses to third-parties because this is regarded as a form of “administering the patent as such”, something which can be done only jointly in a co-ownership by defined shares, in accordance with Section 744(1) German Civil Code.¹⁶⁸ In such a case, under German law¹⁶⁹ a majority vote of the co-owners with regard to the decision of granting a license is possible. In this regard, German law is similar to Australian patent law that stipulates in Section 16 of the 1990 Patents Act that “none of [the co-owners] can grant a license under the patent, or assign an interest in it, without the consent of the others.”

105. In Lithuanian patent law, Article 44(3) stipulates that “[e]ach of joint proprietors of the patent may independently without consent of others assign his share in the patent or bring an action to court for infringement of the patent.” There is no pre-emption right set forth in that provision. However, joint proprietors “[...] may only jointly surrender the legal protection conferred by a patent or conclude a licensing agreement with third parties (see Article 44(4) of the Patent Law of Lithuania).

106. In the United Kingdom, without any agreement to the contrary, a co-owner can exploit the patent for their own gain and without any obligation to account to other co-owners for profit generated.¹⁷⁰ However, the consent of all the co-owners is required to grant a license under the patent or to assign or mortgage a share.¹⁷¹ In *Hughes v Paxman*¹⁷², the Court of Appeal confirmed that a co-owner who wishes to use the rights by licensing them to a third party would not be able to do so without the approval of the other co-owner. Pursuant to section 37 of the Patents Act, the Comptroller of Patents has the power to determine “whether any right in or under the patent should be transferred or granted to any other person or persons” and to make an order “granting any license or other right in or under the patent”.

107. In the Russian Federation, each co-author is entitled to use the invention at their discretion, unless otherwise provided by an agreement among them (Article 1348(2) of the Civil Code). However, the right to obtain a patent for the invention is managed jointly by the authors. Article 1229(3) of the Civil Code applies to the relations among co-authors concerning the distribution of income from the use of the invention and the management of the exclusive right to the invention and specifies that: (1) the exclusive right to the invention is exercised jointly, unless otherwise stipulated by the Civil Code or an agreement between the co-authors; (2) the income derived from the joint use of the invention or the joint disposal of the exclusive right is distributed equally, unless otherwise agreed by the co-authors who are the rights holders. At the same time, each co-author may independently take measures to protect his/her rights to the invention.¹⁷³

108. In conclusion, due to the complicated relationships among co-owners of a patent, it comes as no surprise that in practice, regardless of the jurisdiction, co-owners are advised to conclude a contract that addresses these issues. Frequently, this happens by creating a holding company that holds the legal title to the patent and controls the use of it and the issuance of licenses.¹⁷⁴

¹⁶⁷ Christoph Ann, *Patentrecht*, Section 19 para. 55 (8th ed. 2022) (explaining that such a partnership contract does not need to be established in a certain legal form).

¹⁶⁸ *Oberlandesgericht Düsseldorf* (High Regional Court Düsseldorf), decision of July 26, 2018 – I-15 U 2/17–*Flammpunktprüfungsvorrichtung*; In other jurisdictions, this rule is specifically stipulated in the patent law, for instance in the Republic of Korea, See Article 99(4) of the Korean Patent Act.

F. EMPLOYEE INVENTORS

109. The vast majority of inventions are not made by the “lone inventor” but rather in companies, frequently in distinct research and development divisions, or public institutions such as universities or government agencies. Consequently, inventions made by employees have a high economic relevance. The law must strike a balance between the legitimate interest of the employee as the original inventor claiming inventorship, and the legitimate interest of the employer who provided the infrastructure, funding and often the collective experience and direction, on which the invention was built.

110. In many jurisdictions, the concept of a “service invention” is used to delineate the rights between an employer and an employee. In general, three scenarios are addressed in their laws: (i) an invention created in the course of the employment duty; (ii) an invention created outside the employment duty; and (iii) an invention created outside the employment duty, but the inventor used the infrastructure or fund for the creation of the invention. The legal framework regulating these scenarios, including the procedural requirements, is not the same among various jurisdictions. Nevertheless, modern patent laws generally acknowledge the idea that, in the employer-employee relationship, the employer is entitled to the fruits of the labor, including the right to a patent, while the employee inventor may only have a claim to remuneration, where the law applicable provides so.

111. For instance, pursuant to Article 1370 of the Russian Civil Code, an invention created by an employee in the course of his or her employment duties or a specific assignment of the employer, shall be recognized as an employee invention.¹⁷⁵ The exclusive right to an employee invention and the right to obtain a patent belongs to the employer, unless the employment or civil law contract between the employee and the employer provides otherwise.¹⁷⁶ An invention created by an employee using the employer’s financial, technical or other material resources but not in connection with his or her employment duties or a specific assignment of the employer, shall not be recognized as an employee invention.¹⁷⁷ The right to obtain the patent and the exclusive right to such an invention belongs to the employee, and the employer may, in such a case, demand a non-exclusive license.¹⁷⁸ Article 11 of the Bangui Agreement provides a similar provision.

112. Additionally, in the Russian Federation, the right to obtain a patent and the exclusive right to an invention created under a contract for work or a contract for scientific research, experimental design, or technological work, which did not explicitly provide for its creation, belong to the contractor (executor), unless otherwise stipulated by the agreement between the contractor and the customer (Article 1371(1) of the Civil Code). Similarly, the right to obtain a patent and the exclusive right to an invention created under a contract for the State or municipal needs belong to the executor of the contract, except in cases provided for by the Civil Code (Article 1373(1)). At the same time, the author of the invention, if not the patent holder, is entitled to remuneration (Article 1371(3) and Article 1373(6) of the Civil Code). Under Article 1370(4)(1) of the Civil Code, if an employer, who holds a patent for a service invention, decides to terminate the patent early, it is obligated to: notify the employee (the author of the invention); and upon the employee’s request, transfer the patent to the inventor on a gratuitous basis. The transfer of the exclusive right is formalized through a gratuitous alienation agreement. At the same time, the author of invention retains the right to file a lawsuit if: the employer refuses to conclude the gratuitous alienation agreement; or the employer fails to respond to the inventor's written proposal to conclude such an agreement within the statutory timeframe. Additionally, if the employer fails to notify the author of the early termination of the patent, the inventor may

¹⁷⁵ See the response from the Russian Federation to Note C. 9141.

¹⁷⁶ *Ibid.*

¹⁷⁷ *Ibid.*

¹⁷⁸ *Ibid.*

sue the employer to compel the filing of a petition for patent reinstatement at the employer's expense.¹⁷⁹

113. In China, a similar but different model is used.¹⁸⁰ An invention that is accomplished: (i) in the course of performing the duties of an employee; or (ii) mainly by using the material and technical conditions of an employer; is a service invention. The right to apply for a patent in the service invention belongs to the employer.¹⁸¹ However, in case (ii) above, if the employer has concluded a contract with the inventor providing the right to apply for the patent or the ownership of the patent right, such provision shall prevail. For a non-service invention-creation, the right to apply for a patent belongs to the inventor. Furthermore, Article 8 of the Patent Law provides for, *inter alia*, inventions made under commission. It states that where an invention is accomplished by a party in execution of a commission given to it from others, the right to apply for a patent belongs, unless otherwise agreed upon, to the party that has accomplished the invention.

114. Under Law no. 1540 of 2011 of Colombia, all employment relationships duly entered into as of June 16, 2022, provide for the assignment of industrial property rights by the employee to the employer, including in service contract.¹⁸² In Cuba, if an invention was created for an entity under an employment or service contract, the entity is the patent owner and right holder, in accordance with Article §11(1) of Decree-Law No. 290.¹⁸³ In Egypt, Article 7 of the Law of the Protection of Intellectual Property Rights states that the employer shall have all rights derived from workers' or employees' inventions during the period of work or employment relationship, insofar as the invention falls within the scope of the commission contract or employment relationship.¹⁸⁴ The Lithuanian law provides a similar provision for a service invention created under the employer-employee relation. However, if the invention is made by a person who carries out scientific research, designing, construction works and other works of creative character under contract with a client who finances an appropriate work, the right to the patent for the invention shall be established by such contract.¹⁸⁵

115. In Germany, applying the "inventor principle" stipulated in Section 6 of the [German Patent Act](#), each invention initially belongs to the employee, who made the invention.¹⁸⁶ Under the Act, two types of inventions exist:

- (i) if the invention is classified as a service invention (*Diensterfindung*), the employer may claim the invention; whereas,
- (ii) if the invention is deemed a free invention (*freie Erfindung*) different rules apply.¹⁸⁷

116. Service inventions that are made during the course of the employment are: (a) either created in the context of the work done by the employee; or (b) are based on the experience or activity of the employer.¹⁸⁸ The employee who made a service invention is under the duty to

¹⁸⁵ See the response from Lithuania to Note C. 9141.

¹⁸⁶ See the response from Germany to Note C. 9141. The Employee Inventions Act (*Gesetz über Arbeitnehmererfindungen*) is applicable to employees, civil servants, and soldiers (Section 1). In Sections 40 to 42, it however provides specific rules to civil servants, soldiers and inventions at universities. The Employee Inventions Act may partly apply to persons that are in a similar positions as employees due to their economic dependency (Ann, *Patentrecht*, ed. 6 (2009) §21 II). A Managing Director of a limited liability company may have the obligation to transfer an invention (Higher Regional Court Frankfurt, Decision of April 13, 2017 - 6 U 69/16).

¹⁸⁷ See the response from Germany to Note C. 9141.

¹⁸⁸ Section 4, paragraph 2 of the Employee Invention Act.

notify the employer immediately about the invention in text form.¹⁸⁹ The employer may then declare that it claims the service invention.¹⁹⁰ Even if the employer remains silent, such a claim is deemed declared unless the employer expressly “releases” the invention within four months after receipt of the employee’s report, by making a statement in text form addressed to the employee.¹⁹¹ With the claim of the service invention, all economic rights regarding the invention are transferred to the employer¹⁹², under the duty to apply for a domestic industrial property right for a service invention reported to it¹⁹³ and the entitlement (but not an obligation) to apply for industrial property protection abroad¹⁹⁴.

117. The employee has a claim against the employer regarding adequate remuneration.¹⁹⁵ Additionally, if the employer does not apply for a patent in foreign jurisdictions, the employer must, upon the employee’s request, enable the employee to acquire the industrial property rights in these jurisdictions.¹⁹⁶

118. Inventions made by the employee that do not qualify as service inventions are considered free inventions, for which all economic rights remain with the employee as the inventor, subject to certain conditions.¹⁹⁷ First, the employee has to inform the employer about the invention, unless it is obvious that the invention could not be utilized within the business of the employer. The employee has to provide sufficient information in order to enable the employer to assess whether the invention is indeed a “free invention”. Second, the employee has to offer the employer a non-exclusive right for using the invention on reasonable terms and conditions, if the invention fits the business of the employer. If the employer does not accept the offer within three months, its prerogative to the non-exclusive license expires. As a special form of employee protection, pursuant to Section 22 of the Employee Inventions Act, a derogation from the provisions of the Act by contracts is not permissible to the disadvantage of the employee prior to the notification of a service invention from the employee to the employer.

119. Similar to the law of Germany, Article 58 of the industrial Property Code of Portugal stipulates the mechanism where an employer may exercise its pre-empted right to inventions created by its employees.¹⁹⁸ Furthermore, under the patent law of the Republic of Korea, the invention made by employees in the course of their employment are initially vested in the employee. However, a small or medium-sized enterprise (SME) shall have a non-exclusive license, if an employee acquires a patent.¹⁹⁹ Employers may conclude employment contracts with their employees to reserve the right to obtain a patent. An employee who completes an employee’s invention shall notify the employer of his or her completion in writing without delay.²⁰⁰ Where an employee’s invention is completed jointly by two or more employees, such notice shall be given jointly by the employees.²⁰¹ An employee shall be entitled to a fair compensation where the employer succeeds, under a contract or employment regulation, the right to acquire the patent for an employee’s invention, or is granted an exclusive license.²⁰²

120. In the United States of America, any patent rights to an invention are vested initially in the inventor, regardless whether that person is an independent inventor, self-employed or an

²⁰² Article 15 of the KIPA.

employee. If patent rights are owned by third parties, they must have been transferred by way of conveyance. Thus, the contractual arrangements between employer and employees with regard to inventions are crucial for both parties to allocate the rights appropriately. Unlike in copyright law of the United States of America, there is no work-made-for-hire doctrine in patent law. However, in case a person is specifically employed to invent, he or she might have to assign the invention that was created under the contract to their employer.²⁰³ In *United States v. Dubilier Condenser Corp.*, the Supreme Court of the United States created the so-called “hired to invent” doctrine and decided that “[o]ne employed to make an invention, who succeeds, during his term of service, in accomplishing that task, is bound to assign to his employer any patent obtained.”²⁰⁴ However, such a duty only exists if the employee has only produced that which he or she was employed to invent and if the invention is the precise subject of his or her employment contract.²⁰⁵ On the contrary, if an employee makes the invention in the course of generally working in his or her field of labor and the invention was conceived in performance of the work within this field, the employment contract will not be construed to require an assignment of the patent to the employer.²⁰⁶

121. In the absence of a contract between employer and employee covering the subject of employee-made inventions (or the employee being specifically employed to make an invention), any inventions made by the employee are his/her exclusive property with the qualification that the employer is entitled to a non-exclusive license to make and use the inventions of its employee. This applies in cases where the employer has made some contribution, such as the inventions were made during the hours of employment and/or using the employer’s equipment and materials.²⁰⁷ Such a non-exclusive license is known as an employer’s “shop right”. The Federal Circuit has acknowledged that “[a] ‘shop right’ is generally accepted as being a right that is created in common law, when the circumstances demand it, under principles of equity and fairness, entitling an employer to use without charge an invention patented by one or more of its employees without liability for infringement.”²⁰⁸ It is a judicially created defense to patent infringement, and applied on a case by case basis²⁰⁹.

122. According to Article L.611-7 of the French Intellectual Property Code (IPC), when the inventor is an employee, the right to an industrial property title, absent a contractual clause more favorable to the employee, is governed as follows: inventions made by an employee in the context of an employment contract containing an inventive mission corresponding to the employee’s actual duties, or in the course of studies or research explicitly assigned to the employee, belong to the employer. The employer is obliged to inform the employee-inventor when an application for an industrial property title related to the invention is filed and, where applicable, upon grant of the title. All other inventions belong to the employee; however, if an invention is developed by the employee in the course of performing their duties, within the company’s field of activities, through knowledge or use of techniques or means specific to the company, or using data provided by the company, the employer has the right—under conditions and deadlines set by decree of the Council of State—to claim ownership or the right of enjoyment of all or part of the patent rights associated with the employee’s invention. In this scenario, the employee is entitled to a fair price, which, in the absence of agreement, is determined by the conciliation commission established by Article L.615-21 IPC or by the Judicial Court, taking into account all relevant factors, including the respective initial contributions of the employer and employee and the invention’s industrial and commercial value. The employee-

²⁰⁸ *Beriont v. GTE Labs., Inc.*, 535 F. App’x 919, 923 (Fed. Cir. 2013).

²⁰⁸ *Ibid.*

²⁰⁹ See *McElmurry v. Arkansas Power Light Co.*, 995 F.2d 1576, 27 U.S.P.Q.2d 1129, 1528 (Fed. Cir. 1993) for the factors that may be applied by courts.

inventor must notify the employer of the invention, and the employer must acknowledge receipt under regulated procedures and deadlines. Both parties must share all useful information regarding the invention and refrain from any disclosure that could jeopardize, fully or partially, the exercise of rights conferred by the IPC. Any agreement between employer and employee concerning employee inventions must be documented in writing under penalty of nullity. These provisions also apply, under conditions established by decree of the Council of State, to employees of the State, local authorities, and other public law entities.²¹⁰

123. Furthermore, according to Article L611-7-1 of the French IPC, when the inventor is not an employee covered by Article L611-7 but is instead a natural person hosted under an agreement by a public or private legal entity carrying out research, the right to an industrial property title for inventions made by this inventor is governed as follows, unless a contractual clause more favorable to the inventor exists: inventions made by the inventor in performing either an agreement explicitly including an inventive mission corresponding to their actual tasks, or research explicitly entrusted to them, belong to the hosting legal entity conducting the research. This entity must inform the inventor when an application for an industrial property title concerning the invention is filed and, where applicable, upon grant of that title. All other inventions belong to the inventor. However, for the duration of the hosting period, the hosting legal entity conducting the research may claim ownership or the right to enjoyment of all or part of the patent rights related to inventions made by the inventor in the course of their tasks or activities, within the area of activities entrusted to them by that entity, or through knowledge or use of specific techniques, resources, or information provided by the entity. In such a case, the inventor is entitled to a fair price, determined by mutual agreement or, failing that, by the joint conciliation commission established under Article L615-21 IPC or by the court. The inventor must notify the hosting entity conducting the research of the invention, and the entity must acknowledge receipt according to prescribed statutory procedures and time limits. Both parties must exchange all relevant information about the invention and refrain from disclosures likely to jeopardize, in whole or in part, the rights conferred by the IPC. Any agreement between the inventor and the hosting entity relating to the invention must be in writing, under penalty of nullity.²¹¹

124. Apart from the Bangui Agreement, some other regional patent laws also include provisions for employee inventions, although they rely on national laws of the members of the respective regional organization in many aspects. For instance, the EAPC and EPC provides that, if the inventor is an employee, the right to a patent shall be determined in accordance with the law of the State in which the employee is mainly employed. If such a State cannot be determined, the applicable law is that of the State in which the employer has the place of business. Decision 486 of the Andean Community provides in Article 23 that “[w]ithout prejudice to the provisions of the national legislation of each member country, in the case of inventions occurring in the course of employment relations, the employer, whatever its form and nature, may transfer part of the economic benefits deriving from the inventions to the employee inventors with the view to promoting research activity”.

²¹⁰ See the response from France to Note C. 9260.

²¹¹ *Ibid.*

G. LEGAL CONSEQUENCES OF INACCURATE DESIGNATION OF INVENTORS

125. If the applicant fails to provide the names of the inventors or indicates the wrong inventors (either in good faith or intentionally), there can be different consequences to the application and different kinds of remedies may be available, depending on the applicable law.

126. Importantly, it is notable that many jurisdictions do not appear to have requirements to validate the entitlement of the named inventor(s) to the invention at the point of filing (i.e., there is only a check to see that someone is named).²¹²

Failure to Indicate Inventors

127. In implementing Article 4^{ter} of the Paris Convention (the inventor's right to be named in a patent), national/regional patent laws typically requires an applicant to indicate the name(s) of the inventor(s) in a patent application, as part of the formality requirements. Usually, a patent office invites the applicant to comply with the requirements within a prescribed time limit. For example, where a Japanese patent application does not indicate an inventor (within the meaning of its patent law), this is considered as an incomplete description. The applicant is ordered to engage with the amendment procedures within a specified time frame, because it does not comply with these necessary formalities.²¹³ If the applicant fails to do so, the office rejects the application.

128. In Israel, in contrast to many other jurisdictions, there is no legal requirement for the inventor(s) to be named. What is required under Israeli patent law is that "If the applicant is a person other than the inventor, then he shall state in the application how he came to be the owner of the invention". In practice it is sufficient that the applicant indicates in the patent application one of three options of doing so: (1) "entitlement by operation of Law", (2) "entitlement by transfer", or (3) "entitlement by agreement". Under Israeli patent law "the person who submitted a patent application is deemed the owner of the invention, as long as the contrary has not been proven".²¹⁴

Corrections to the Designation of Inventors

129. Many patent laws allow for the correction of a wrongfully designated inventor. For example, it is possible to amend the designation of the inventor(s) (either by replacing a person indicated as an inventor with another person or adding a new person as another inventor) in a Japanese patent application as long as it is pending before the Japan Patent Office. In so doing, the applicant shall provide a reason for the change and submit a declaration from each and every inventor indicated in the application before and after the change, in which a person(s) who is a true inventor(s) and a person who is not an inventor shall be identified.²¹⁵

130. In many countries, an error in the indication of the inventor(s) is not a ground for invalidation of the patent. In the Russian Federation, changes may be made to the list of authors, specified in a patent application, prior to the State registration of the invention (paragraph 4(9) and paragraph 5(6) of the Rules for Drafting, Filing, and Examining Documents Substantiating Legally Significant Actions for the State Registration of Inventions, approved by Order No. 107 of the Ministry of Economic Development of the Russian Federation dated

²¹² For example, Australia and Canada.

²¹³ See the response from Japan to Note C. 9141.

²¹⁴ Section 11(b) and Section 76 of the Israel Patents Law, 5727 – 1967; Legal Consequences of Inaccurate Designation of Inventor," Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*.

²¹⁵ Japan Patent Office (JPO), "Correction of Inventors," Section 2: "Change of Inventor (Add/Delete)", <https://www.jpo.go.jp/system/process/shutugan/madoguchi/info/faq-after-filing/hatsumesha-hose/index.html>.

February 21, 2023). This requires documentary evidence of consent to the change in authorship, signed by all individuals previously listed as authors and those newly added. Such documentation must confirm: the absence of disputes among individuals previously listed as authors and those newly added; the revised list of authors; information about their creative contribution to the creation of the invention. Under Article 1398(1)(5) of the Civil Code of the Russian Federation, an invention patent may be declared invalid if it: identifies a person as the author of the invention or patent holder who is not entitled to such status under the Civil Code; or fails to identify a person as the author or patent holder in accordance with the Civil Code. Under Article 1398(2) and 1406(1)(1) and (2) of the Civil Code, a judicial procedure is established for challenging the patent on these grounds.

131. Australia, Canada, Japan, the Republic of Korea, Singapore, Switzerland, and the United Kingdom reported provisions for the applicant to correct details of a patent application, including the inventor(s). For example, In Australia s. 104 of the Patents Act provides that an applicant can make amendments to their parent application where there is a clerical error or an obvious mistake. This includes amending the patent request form that contains a field for listing the inventors for the claimed invention and may require a statement of reasons for leave to amend.²¹⁶

132. In Finland, there are provisions in the Patenttikäsikirja (i.e., the Guidelines for search and examination) for the patentee to remove themselves as a designated inventor. In Canada, the patentee is able to disclaim part of a patent specification for which they claimed they were the inventor of but were not, but, as per s. 48 of the Patent Act, this is conditional on the patentee having included that part by mistake, accident, or inadvertence, and without any willful intent to defraud or mislead the public.²¹⁷

Invalidation and Revocation of a Patent

133. In some jurisdictions, an inaccurate designation of the inventor may result in invalidation or revocation, particularly where it may indicate a defect in entitlement. A wrongful designation may, from the outset, call into question whether the applicant or the patentee derived title from the true inventor; where the right to a patent has not been duly transferred, the applicant or the patentee may not be a legitimate successor in title under the applicable law.

134. In the United States of America, an improper declaration of inventorship in a patent application can lead to invalidation, because “[a] patent is invalid if more or fewer than the true inventors are named”²¹⁸ or the unenforceability of the patent, in case there was intent to deceive the United States Patent and Trademark Office (USPTO)²¹⁹. There is, however, also the possibility to correct errors in the inventorship. For patent applications, 35 U.S.C. §116(c) applies, giving the Director of the USPTO the corrective authority, whereas for issued patents, a federal court or the USPTO can, pursuant to 35 U.S.C. §256, rectify the designation of the inventor. As courts have to allow a patentee to rectify a wrongly stated inventorship before declaring the patent invalid,²²⁰ the severity of improper inventorship is mitigated.

²¹⁶ Legal Consequences of Inaccurate Designation of Inventor,” Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*.

²¹⁷ Legal Consequences of Inaccurate Designation of Inventor,” Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*.

²¹⁸ *Gemstar-TV Guide Int'l v. ITC*, 383 F.3d 1352, n.1, (Fed. Cir. 2004).

²¹⁹ *Frank's Casing Crew & Rental Tools v. PMR Techs.*, 292 F.3d 1363, 1381 (Fed. Cir. 2002).

²²⁰ *Checkpoint Systems, Inc. v. All-Tag Security S.A.*, 412 F.3d 1331, 1340 (Fed. Cir. 2005).

135. Table 1 below indicates that, in many jurisdictions, misnaming an inventor as such is not a standalone ground of revocation; rather, consequences typically flow through entitlement/usurpation doctrines. Some patent systems expressly state that a patent is not invalid merely because it was granted to a person not entitled, which revocation may still be available on broader entitlement, fraud, misrepresentation, or non-disclosure grounds. In other systems, a patent may be invalidated where the grant issues to a person lacking the right to the patent. In at least one jurisdiction in the table below, failure to name the correct inventor could theoretically be a ground for invalidity, though the issue is unsettled.²²¹

Table 1: Invalidation or Revocation from Incorrect Inventorship or Entitlement in Selected Jurisdictions²²²	
Australia	The patent is not invalid merely because the patent was granted to a person who was not entitled to it (s.22A) but revocation is possible under s.138.
Canada	Failure to name the correct inventor of the claimed invention could theoretically invalidate a patent under subsection 27(1) of the Patent Act. ²²³
Chile	A wrongly named inventor was grounds for invalidation of the patent before 2022, and any legitimate patent owner had no other option but to request the declaration of invalidity of the registration. However this law has now been changed, and the patent may be transferred to the rightful owner by virtue of a new usurpation action (Art.50bis).
Finland	Inaccurate designation of inventor as such is not a statutory ground for revocation (s.53).
Germany	A patent cannot be revoked/invalidated just because of a wrongly designated inventor. However, a patent can be revoked/invalidated in the case of usurpation (Section 21 para. 1 no. 3 German Patent Act). This requires that the essential content of the patent has been taken from the descriptions, drawings, models, implements or equipment of another person or from a process used by this person without their consent.

²²¹ Legal Consequences of Inaccurate Designation of Inventor,” Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*.

²²² Legal Consequences of Inaccurate Designation of Inventor,” Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*; unless otherwise noted all citations in the table refer to the primary patent law in the respective jurisdictions with the exception of Switzerland which references both the Federal Act on Patents for Inventions (Patents Act, PatA), of 25 June 1954 (Status as of 1 July 2025) and the Ordinance on Patents for Inventions (Patents Ordinance, PatO), of 19 October 1977 (Status as of 1 July 2025).

²²³ The Federal Court in Canada has the power to void a patent under subsection 53(1) of the Patent Act where a material allegation in the petition is untrue. However, case law has established that a failure to name the correct inventor is unlikely to render the patent void unless the allegation was willfully made for the purpose of misleading. The state of the law in Canada is still unsettled on this point.

Israel	Patents are not invalidated due to wrongly naming inventors, unless it has bearing to the question of ownership of the patent. ²²⁴
Japan	If the patent has been granted on a patent application filed by a person that does not have the right to the grant of a patent for the invention, a request for a patent invalidation trial may be filed (Art.123).
Morocco	A patent cannot be invalidated or revoked due to a wrongly named inventor or incorrect entitlement.
Republic of Korea	Where a patent has been granted to a person not entitled to obtain the patent it can be invalidated (Art.133).
Singapore	<ul style="list-style-type: none"> - There is no penalty for naming the wrong inventor - this is reflected in the wording of s 24(2)(a), which requires the applicant to identify the person(s) they believe to be the inventor(s). - A patent can be revoked if the “patent was granted to a person who was not entitled (either alone or with other persons) to be granted that patent” or if the “patent was obtained fraudulently, on any misrepresentation, or on any non-disclosure or inaccurate disclosure of any prescribed material information, whether or not the person under a duty to provide the information knew or ought reasonably to have known of such information or the inaccuracy”(s.80).
Switzerland	<ul style="list-style-type: none"> - Failure to mention an inventor leads to the rejection of the patent application (Art. 35 Sect. 3 PatO). There is no direct penalty for naming the wrong inventor. - The court shall however, on application, declare the nullity of the patent if the proprietor of the patent is neither the inventor nor his successor in title, nor has a right to the grant of the patent on other legal grounds (Art. 26 Sect. 1 let. d PatA).
United Arab Emirates	If the applicant or patent holder is not a legitimate owner of the invention, and not entitled for the patent, the patent may be cancelled in the post-grant re-examination or invalidated in court (Cabinet Resolution no. 6 ²²⁵ , Arts. 42 and 52).
United Kingdom	- There is no penalty for naming the wrong inventor - this is reflected in the wording of s.13(2)(a), which requires the applicant to identify the person(s) they <i>believe</i> to be the inventor.

²²⁴ In Israel, any person may oppose the grant of a patent before granting, or request the cancellation of a patent, for grounds in which the opponent, and not the applicant, is the owner of the invention (s.30, s.31(3), s.73B of the Law).

²²⁵ Cabinet Resolution no. 6 of 2022 on Implementing Regulation of Federal Law no. 11 of 2021 on the Regulation and Protection of Industrial Property Rights.

	- However, a patent can be revoked if the "patent was granted to a person who was not entitled to be granted that patent" [s.72(1)(b)].
--	---

Transfer of Rights

136. Where inventorship has been inaccurately stated, many legal systems provide mechanisms to transfer or vest rights to the person entitled, rather than to extinguish protection. Depending on the stage of proceedings, remedies may include assignment of the application, transfer of the granted patent, rectification of the register, or a judicial declaration clarifying entitlement. Such measures may be available pre-grant and post-grant, may operate alongside revocation/nullity actions, and may be subject to limitation periods and, in some instances, bad-faith exceptions.

137. In France, according to L611-8, if an industrial property title has been applied for either an invention taken from the inventor or his successors in title, or in breach of a legal or contractual obligation, the injured party may claim ownership of the application or the title issued. Actions claiming ownership shall be barred after five years from publication of the grant of the industrial property title. However, in the event of bad faith at the time the title was issued or acquired, the limitation period shall be five years from the expiry of the title. Furthermore, in France, the applicant must identify the inventor, who must be a natural person. INPI does not verify the accuracy of the designation of the inventor, which is the exclusive responsibility of the applicant or their representative. However, the office makes sure that an inventor has been duly designated.²²⁶

138. Table 2 below shows that in many jurisdictions, transfer remedies may be available through both administrative and judicial channels. Additionally, some frameworks distinguish between pre-grant and post grant systems. In at least one jurisdiction in the table below, an eligible person may obtain a declaration of eligibility for a revoked patent. In at least one system, assignment actions sit alongside nullity as options for the entitled person. Under some legal frameworks, damages are provided in connection with usurpation, in addition to vesting title in the person entitled.²²⁷

Table 2: Transfer of Rights in Selected Jurisdictions²²⁸	
Australia	- Eligible person may apply for a declaration of the person's eligibility for a revoked patent and the ineligibility of a former patentee (s.35). - Register of Patents may be rectified by Commissioner (s.191A) or by court order (s.192).
Canada	Federal Court has jurisdiction to vary named inventors on the patent record after the patent is granted (s.52).

²²⁶ See the response from France to Note C. 9260.

²²⁷ Legal Consequences of Inaccurate Designation of Inventor," Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*.

²²⁸ Legal Consequences of Inaccurate Designation of Inventor," Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*; unless otherwise noted all citations in the table refer to the primary patent law in the respective jurisdictions.

Chile	Legitimate owner may request the transfer of the patent registration, as well as requesting damages as compensation (art.50bis).
Finland	Claim by true inventor may result in transfer proceedings by the office pre-grant (s.18) or in court post-grant (s.53).
Germany	Entitled person or a party aggrieved by usurpation can require the patent applicant to assign to him the right to the grant of the patent. Where the application has already resulted in a patent, he can require the proprietor of the patent to transfer the patent (s.8).
Israel	<p>- If ownership of the invention is challenged by way of pre-grant opposition (s.31(3)), then the opponent may request that the patent be granted to him, and the Registrar may – in addition to any other relief – grant the patent to the person who proved that he is the owner of the invention (s.33(a)).</p> <p>- After a patent is granted, a civil claim for the transfer of rights on the grounds of an ownership can be filed with the court. In patent invalidation proceedings based on the grounds of ownership, there is no remedy for the transfer of ownership.²²⁹</p>
Japan	Person that has the right to the grant of the patent for the invention pertaining to the patent may request that the patentee transfer the patent right (Art.74).
Morocco	Aggrieved person may claim ownership of the granted title for an invention stolen from the inventor (Art.19).
Republic of Korea	Person who holds the right to acquire the patent may file a claim for the transfer of the patent (Art.99-2).
Singapore	<p>- Before a patent is granted, any of the co-proprietors of the application may question whether any right in the application should be transferred or granted to any other person (s.20(1)(b)).</p> <p>- After a patent is granted, any person having (or claiming) a proprietary interest in the patent may question whether any right in the patent should be transferred or granted to any other person (s.47(1)(c)).</p>
Switzerland	The Swiss Patents Act provides an action for assignment (Art. 29 PatA): When the patent application has been filed by an applicant who is not entitled to the grant of the patent, the entitled person may apply for assignment of the patent application or, if the patent has already been granted, he may apply for assignment of the patent or file an action for nullity.

²²⁹ CivA 4052/19 Y.S.M. Lebinyan v. Tadbik (12/9/2020).

United Arab Emirates	Owner of the right to the invention may request the Ministry to transfer the application or patent of the invention or the utility certificate to him (Art.9).
United Kingdom	Person who has (or claims to have) a proprietary interest in the patent may question whether any rights under the patent should be transferred or granted to someone else (s.37).

Persons Entitled to Challenge the Designation of Inventor

139. In some countries, the opportunity to challenge an inaccurate designation of inventor or an incorrect entitlement to the invention is only available to a person claiming to be the true inventor. In other countries, third parties may be able to challenge the accuracy of the named designated inventors.²³⁰

140. Table 3 below sets out the range of persons who may challenge the designation of inventor(s) across several different jurisdictions. The table shows that standing often comprises one of the following options: (i) applicant-initiated correction routes; (ii) actions by the true inventor; (iii) proceedings by persons with a proprietary interest; and (iv) challenges by any person or any person interested. Additionally, in a number of frameworks, public authorities may initiate or entertain challenges, including via third-party submissions during examination. Standing may differ pre-grant versus post-grant, with some systems reserving broader standing pre-grant and channeling post-grant disputes to courts or specific entitlement procedures.²³¹

Table 3: Persons Entitled to Challenge the Designation of Inventor²³²	
Australia	<ul style="list-style-type: none"> - Applicant (to amend their own application, s.104). - Person claiming the patent should be granted to them as well as or instead of the applicant (s.35, 36). - Minister or any other person opposing the grant of a patent for inaccurate patentee entitlement (s.59-standard patents, s.101M-innovation patents). - Minister or any other person may apply to a prescribed court for an order revoking a patent due to inaccurate patentee entitlement (s.138).
Canada	<ul style="list-style-type: none"> - Applicant can request a correction in the naming of inventors (patent rules s.106).

²³⁰ Legal Consequences of Inaccurate Designation of Inventor," Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*.

²³¹ *Ibid.*

²³² Legal Consequences of Inaccurate Designation of Inventor," Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*; unless otherwise noted all citations in the table refer to the primary patent law in the respective jurisdictions with the exception of Switzerland which references both the Federal Act on Patents for Inventions (Patents Act, PatA), of 25 June 1954 (Status as of 1 July 2025) and the Ordinance on Patents for Inventions (Patents Ordinance, PatO), of 19 October 1977 (Status as of 1 July 2025).

	<ul style="list-style-type: none"> - Patentee may disclaim the subject matter in the patent (Patent Act s.48). - Person claiming the patent should be granted to them as well as the named applicant(s) (s.31). - The Commissioner or “any person interested” can apply to the Federal Court to vary or expunge the record of inventorship (s.52).
Chile	<ul style="list-style-type: none"> - The “legitimate owner” may request the transfer of the patent registration (Art.50bis). - “Any interested party” may file an opposition to an application (up to 30 days after publication).
Finland	<ul style="list-style-type: none"> - Applicant can add inventor after filing application (s.C.3.1 Patenttikäsikirja, no statutory basis). - Inventor may remove themselves (s.C.3.1 Patenttikäsikirja, no statutory basis). - Someone claiming to be the true inventor (s.17, 18, 53).
Germany	<ul style="list-style-type: none"> - The entitled person in respect of whose invention an application has been filed by a non-entitled person (s.8). - A party aggrieved by usurpation (s.8).
Israel	<ul style="list-style-type: none"> - Any person may oppose the grant of a patent before granting, for grounds in which the opponent, and not the applicant, is the owner of the invention (s.s.30, s.s.31(3) of the Law). According to case law, an opposition on such grounds would not be limited to the true owner, but open to any person.²³³ - The inventors, or next of kin, have an inalienable right to demand that their names be stated in specifications, in the Register and in the patent certificate (s.39, s.42 of the Patent Law).
Japan	<ul style="list-style-type: none"> - A person undertaking a procedure may make an amendment (Act.17). -The person that has the right to the grant of the patent for the invention pertaining to the patent may request that the patentee transfer the patent right (Art.74). -A person that has the right to the grant of the patent may file a request for a trial for patent invalidation (Art.123).
Morocco	<p>An inventor may oppose being mentioned in a patent (Art.20).</p>
Republic of Korea	<ul style="list-style-type: none"> - Applicant can add or correct the names of the inventors (Art.28(1) of the Enforcement Rules).

²³³ CivA 217/86 Shachter v. Abmatz Ltd. 44(2) PD 846 (1990); CivA (DC TA) 3032/06 Kamil v. Bezeq Benleumi Ltd.- P.T. Nevo Legal Database (Jan. 16, 2007).

	<ul style="list-style-type: none"> - Between filing and grant, information can be provided by a third party and the examiner may refer to the provided information when making a rejection decision (Art. 63-2). - An interested party (limited to those who have the right to obtain a patent) can seek to invalidate a patent or transfer the rights (Art.133, Art.99-2). - An examiner can seek to invalidate a patent (Art.133).
Singapore	<ul style="list-style-type: none"> - Applicant may apply to Registrar to correct an error in the Statement of Inventorship (r.91). - "Any person" can refer the question of entitlement to the patent to the Registrar pre-grant (s.20(1)(a)). - Any person having (or claiming) a proprietary interest in the patent may question who are the true proprietors of the patent (s.47(1)(a)) or whether the patent should have been granted to the persons to whom it was granted (s.47(1)(b)). - Any person who alleges that he ought to have been mentioned as inventor in any patent/application or any person who alleges that any inventor(s) in any patent/application ought not to have been so mentioned (s.24).
Switzerland	<ul style="list-style-type: none"> - Both the Applicant and the named Inventor can correct errors in the Statement of Inventorship (Art. 37 PatO). - A third party can file an action for the assignment of the patent application if the application has been filed by an applicant who is not entitled (Art. 29 PatA, for the entitlement see Art. 3 PatA). If the patent has already been granted, third party may file for assignment or nullity of the patent (assignment: Art. 29 PatA; nullity: Art. 26 PatA).
United Arab Emirates	<ul style="list-style-type: none"> - "Applicant" may request to amend errors (including correction, addition or deletion of inventor) in the application (Cabinet Resolution no. 6 Art.26). - "Anyone" to request cancellation of the registered patent through the office (Cabinet Resolution no. 6 Art.42). - "A concerned party with substantial interest" to invalidate the patent through the courts (Cabinet Resolution no. 6 Art.42). - The "true owner of the invention" to transfer the application or patent (Federal Law no. 11 Art.9).
United Kingdom	<ul style="list-style-type: none"> - Applicant may apply to comptroller to correct a clerical error, including name of inventors (s.117). - Any person who alleges that a person mentioned as inventor should not to have can apply to the comptroller for a certificate to that effect (s.13(3)).²³⁴

²³⁴ Historically, claims under this section of UK patent law have been limited to entities with a direct interest in the patent.

	<p>- Any person who claims that the patent should be granted to them instead of or as well as the applicant (before or during application, s.8, 12, 82).</p> <p>- Any person who has (or claims to have) a proprietary interest in the patent (after grant, s.37, 72(1)(b)).</p>
--	--

Timing of Challenges to the Designation of Inventor

141. In some jurisdictions, the possibility to challenge is confined to a defined time period during the lifetime of the application or patent. In others, challenges may be initiated at any point throughout the duration of the application or patent.

142. Figure 1 below presents a simplified comparison of the procedural windows, across a number of jurisdictions, within which the designation of inventor or entitlement may be challenged. “Third parties” refers to persons who need not demonstrate a proprietary interest in the application or patent; “interested parties” refers to persons who claim a right in the application or patent. In some jurisdictions, the opportunity to challenge at a given stage may arise under more than one statutory or procedural provision. For clarity, applicant-initiated amendments/corrections to their own applications are not depicted.²³⁵

143. Note that the opportunity to challenge at a particular time may come from one or more provisions of a particular country. For example, the right to challenge the entitlement to a patent in the UK falls under the Patents Act sections 8, 12, and 82 for pre-grant challenges, and sections 37 or 72 for post-grant challenges, which are normally limited to a time period of 2 years after the grant of the patent.²³⁶

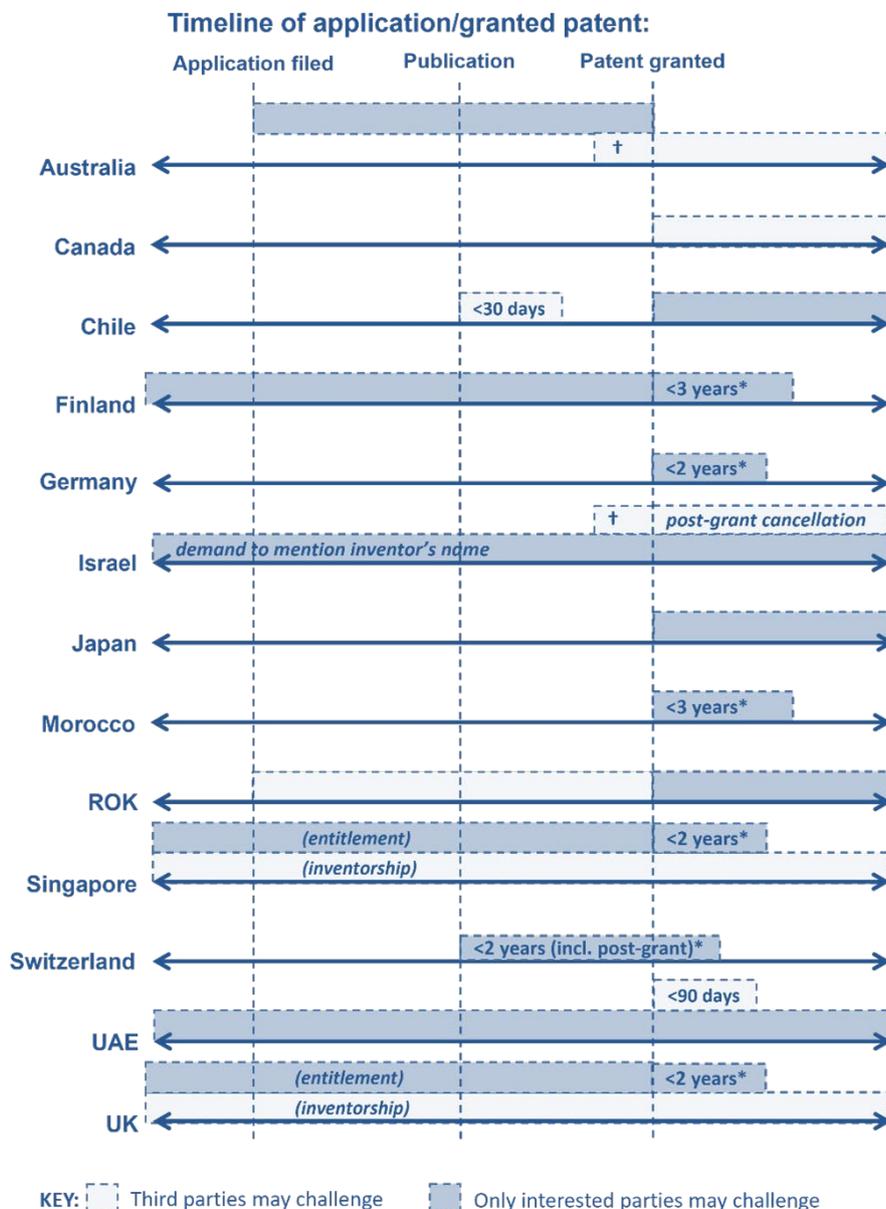

144. In most cases where the time available to challenge is limited, there may be exceptions allowed for instances where the inaccurate designation was a result of the applicant acting in bad faith. For example, in Singapore a claim may be made up to a period of 2 years after the date of the grant, unless it is shown that any person registered as a proprietor of the patent knew at the time of the grant or, as the case may be, of the transfer of the patent to the person that the person was not entitled (either alone or with other persons, as the case may be) to the patent (s 47(5)(b)).²³⁷

²³⁵ Legal Consequences of Inaccurate Designation of Inventor,” Joint submission of Australia, Canada, Chile, Finland, Germany, Israel, Japan, Morocco, Republic of Korea, Singapore, Switzerland, the United Arab Emirates, and the United Kingdom to the WIPO Standing Committee on the Law of Patents, in relation to the update of document SCP/35/7 *Artificial Intelligence (AI) and Inventorship*.

VI. THE “DABUS CASE”

A. OVERVIEW OF THE DABUS APPLICATIONS

145. Against the backdrop of the speed of technological development in the field of AI, it is no surprise that AI systems support humans in the process of making inventions and are, by some, considered to be sole inventors as such.²³⁹ The most prominent example of the latter view is the so-called DABUS case, named after the AI system “Device for the Autonomous Bootstrapping of Unified Science” (DABUS).

146. In its simplest form, the operation of that AI system can be explained as a system of two neural networks.²⁴⁰ The first network is trained on data, which alters the connection weights between the nodes and stores the data. The first network then “generates noise” by further altering its own connection weights, essentially corrupting the data it has been trained on, which generates novel output. The novel output is a variation of the objects the system has been initially trained on. The second network knows what data the first network was trained on, and thus can identify whether what is coming out of the first network is new and how different it is. The second network can control the level of noise in the first network and can also be trained to model the first network outputs. In short, it is alleged that the first network produces new outputs at superhuman speed and the second network evaluates how “well” these outputs will perform. With today’s technology, such an AI system can be composed of thousands of neural networks, each representing certain concepts, such as “warmth” or “enjoyment” and how they relate to each other, e.g., warm food can result in enjoyment. Later, in unsupervised operation, it is claimed that the machine combines basic ideas into complex ideas and stops when a complex idea terminates in a particularly salient concept.

147. Allegedly, DABUS made two separate inventions, namely: (i) a flashing light beacon for attracting enhanced attention in emergency situations; and (ii) a fractal food container. Purportedly, as to the former, DABUS was not told to invent “a flashing emergency light” but rather to be on the lookout for things that could prevent death.²⁴¹ Therefore, it allegedly combined the ideas for a new flashing light mechanism with the need to attract attention in an emergency, and essentially generated a patent claim.²⁴²

148. Patent applications for these two inventions were initially filed by Stephen Thaler in the United Kingdom and with the EPO, as there was no need to initially disclose the inventor in both jurisdictions.²⁴³ After having been invited by the EPO to provide an inventor, Thaler designated DABUS as the inventor and stated himself as the employer of the AI system. Later, Thaler argued that he had obtained the right to the patent as a successor in title. It is reported that Thaler had subsequently filed the applications in 15 additional jurisdictions.²⁴⁴

149. The International Bureau of WIPO received an international application pursuant to Article 3(1) of the PCT with the application number PCT/IB2019/057809 and the filing date of September 17, 2019. On the PCT request Form, the inventor was named as “DABUS, The Invention was autonomously generated by an artificial intelligence”. Furthermore, a declaration regarding the identity of the inventor pursuant to PCT Rules 4.17(i) and 51*bis*.1(a)(i) was submitted, which contained the following:

²³⁹ Ryan Abbott, Intellectual property and artificial intelligence: an introduction, in *Research Handbook on Intellectual Property and Artificial Intelligence*, p. 2, 11-13 (Ryan Abbott ed., 2022).

²⁴⁰ The explanation in this paragraph regarding how DABUS works is taken from *Ibid*, p. 17.

²⁴¹ *Ibid*.

²⁴² *Ibid*.

²⁴³ *Ibid*, p.16.

²⁴⁴ *Ibid*.

“DABUS, The Invention was autonomously generated by an artificial intelligence of 1767 Waterfall Dr St. Charles, Missouri 63303 United States of America

is the inventor of the subject matter for which protection is sought by way of this international application”.

150. The international application was processed normally, since in accordance with PCT Article 4(4), even the failure to indicate the name and other prescribed data concerning the inventor on the request Form shall have no consequence in any designated State whose national law requires the furnishing of the said indications but allows that they be furnished at a time later than that of the filing of a national application. Furthermore, the failure to furnish the said indications in a separate notice shall have no consequence in any designated State whose national law does not require the furnishing of the said indications.²⁴⁵

B. IP OFFICE DECISIONS AND JUDGEMENTS OF COURTS

151. Various IP Offices received DABUS patent applications either via the PCT application entering in the national phases or by direct filing. In the following, some of the proceedings in the IP Offices and courts (if available) will be outlined.

Australia

152. The PCT application entered into the national phase in Australia on September 9, 2020. IP Australia found that treating the AI machine as an inventor is not consistent with Section 15(1) of the Patents Act²⁴⁶. Specifically, it does not meet Section 15(1)(a) that requires an inventor being a person. An assignment from an AI machine to the applicant according to Section 15(1)(b) of the Patents Act would not be possible, since the law does not presently recognize the capacity of an AI to assign property.²⁴⁷ Further, Section 15(1)(c) of the Patents Act provides that a patent may be granted to a person who derives the title to the invention from the inventor. However, that provision was also found to be non applicable. IP Australia observed that although “it is open to argument that an artificial intelligence machine could be regarded as communicating information about an invention to the owner of the machine for any and all purposes”, the AI machine cannot have a “beneficial interest in any property” as set out in the established case law.²⁴⁸ As AI cannot be an inventor, IP Australia determined that it is not possible to identify a person who can be granted a patent. Thus, the application did not comply with regulation 3.2C of the Patent Regulations, which requires, among others, the applicant to provide the name of the inventor. Consequently, IP Australia concluded that the application lapsed pursuant to regulation 3.2C(5).

Court decisions

153. The decision of IP Australia was appealed. The Federal Court of Australia ruled that an AI system can be an inventor for the purposes of the Australian Patents Act 1990.²⁴⁹ The ruling was, *inter alia*, based on the argument that the term “inventor” is an agent noun and as such can be a person or a thing that invents.²⁵⁰ Furthermore, it was held that nothing in the

²⁴⁵ PCT Article 4(4).

²⁴⁶ Section 15(1) of the Australian Patents Act states:

“(1) Subject to this Act, a patent for an invention may only be granted to a person who:

(a) is the inventor; or
(b) would, on grant of a patent for the invention, be entitled to have the patent assigned to the person; or
(c) derives title to the invention from the inventor or a person mentioned in paragraph (b); or
(d) is the legal representative of a deceased person mentioned in paragraph (a), (b) or (c).

²⁵⁰ *Ibid.*, para. 120.

Australian Patents Act expressly refutes the proposition that an AI can be an inventor²⁵¹ and that the ruling merely reflects reality of inventions and an evolving nature of the term “inventor” just as with the term “inventions” developed over time.²⁵² Also, the decision draws attention to the distinction between ownership and inventorship by highlighting the fact that acknowledging DABUS as the inventor does not mean, at the same time, that the AI owns the invention.²⁵³

154. The decision of the Federal Court of Australia was reversed by the Full Federal Court of Australia in April 2022, which ruled that an AI system cannot be an inventor under the Australian Patents Act, and rather, the inventor must be a natural person.²⁵⁴ Although the term “inventor” is not defined in the Patents Act, that term in Section 15(1)(a) is considered to be “the person who is responsible for the inventive concept”.²⁵⁵ With a view to the well-established jurisprudence regarding the identification of an inventor, the court stated that “the law relating to the entitlement of a person to the grant of a patent is premised upon an invention for the purposes of the Patents Act arising from the mind of a natural person or persons”.²⁵⁶ It thus found that it was a human endeavor that was rewarded by the grant of a patent.²⁵⁷

155. As the High Court of Australia has denied further appeal, the decision of the Full Federal Court of Australia is final.²⁵⁸

156. [The DABUS decision is discussed in IP Australia’s Patent Manual of Practice and Procedure, making it clear that a human inventor is required. The principles for considering human inventorship are also summarized in the manual.](#)²⁵⁹

Brazil

157. Following the national phase entry of the PCT application, an application BR 11 2021 008931-4 A2²⁶⁰ contained “DABUS” as an inventor with the explanation that the invention was autonomously generated by AI. Currently, the Brazilian National Institute of Industrial Property (INPI) holds the view that an inventor is a natural person, and has no specific definition of who the inventor should be in the context of an invention created by AI.²⁶¹ Consequently, the Federal Attorney Office of INPI issued a legal opinion, in August 2022, indicating that it is not possible to designate AI as an inventor.²⁶²

Canada

158. Following the national phase entry of the PCT application in Canada, the Canadian Intellectual Property Office (CIPO) started processing the DABUS patent application (CA 3137161). It issued a compliance notice on November 8, 2021.²⁶³ The notice referred to the fact that the patent application listed a machine as an inventor. Consequently, the application is not in compliance with Section 27(2) of the Canadian Patent Act (a patent application must be filed by the inventor or the inventor’s legal representative) and Section 54 of the Patent Rules (*inter alia*, an indication of the name and postal address of each inventor and a statement of

²⁶³ Compliance Notice by CIPO, dated November 8, 2021, searchable at: <https://www.ic.gc.ca/opic-cipo/cpd/eng/searchMenu.html>.

applicant's entitlement to file), since under Canadian law, it does not appear possible for a machine to have rights or to transfer rights to a human.

159. In its response dated July 22, 2022 to the compliance notice,²⁶⁴ the applicant argued that it derived entitlement to file a patent application through its ownership of DABUS, based on the doctrine of property arising from accession, according to which the owner of a thing is also the owner of the fruits of that thing.

Germany

160. In March 2020, the German Patent and Trade Mark Office (*Deutsches Patent- und Markenamt*, DPMA) rejected two patent applications containing DABUS as an inventor, arguing that only a natural person can be named as an inventor in a patent application according to section 37 of the German Patent Act²⁶⁵. The DPMA based its reasoning, amongst others, on the wording of section 63(2) of the Patent Act relating to a wrongful designation of an inventor, which referred to the inventor's person ("*die Person des Erfinders*"). In its opinion, that wording indicated a need for a natural person to be an inventor. The DPMA also referred to the purpose of naming natural persons: names serve not only identification purposes but enable natural persons to exercise their rights. According to the German Civil Code (BGB), which reflects the decision of the German legislator, only natural persons (section 1 ff. BGB) and legal persons (sections 21 ff. BGB) can be the bearers of rights and obligations. As an AI system is a neither legal nor natural person, it cannot bear the inventor's personality right ("*Erfinderpersönlichkeitsrecht*"), which also includes the substantive right to the patent (section 6 PatG) or the right to be named (section 63 PatG).²⁶⁶ Further, the DPMA referred to case law²⁶⁷ showing that a legal entity cannot be an inventor. In addition, as the AI cannot bear rights and obligations as non-natural and non-legal person, it cannot transfer the right to the patent according to section 6 PatG.²⁶⁸

161. Subsequently, the PCT application entering the national phase before the DPMA was equally rejected in January 2023 for the same reasoning.

Court decisions

162. The above decisions of DPMA rejecting the two German patent applications were appealed to the German Federal Patent Court (BPatG). As to the case regarding the patent application DE1020191281202, the BPatG referred to the concept of the inventor's moral rights, which finds its expression in Section 37(1) of the Patent Act,²⁶⁹ to reject the idea that an AI as such could be an inventor. Consequently, an AI system cannot be designated as an inventor in a patent application. The BPatG also found that there is no room for developing the law further through adjudication, as it denied the existence of a lacuna with regard to the rule on the designation of the inventor.

163. However, the BPatG also found that the designation of the inventor in a specific way, namely, "[name of natural person], who caused the artificial intelligence DABUS to generate the invention" is admissible on the patent application form and sufficient for the designation of the

²⁶⁴ Searchable at: <https://www.ic.gc.ca/opic-cipo/cpd/eng/searchMenu.html>.

²⁶⁵ Section 37(1) of the German Patent Act states:

"(1) Within 15 months after the date of filing or, if an earlier date is claimed to govern the application, within 15 months after that date, the applicant is to designate the inventor or inventors and affirm that, to his or her knowledge, no other persons participated in the invention. Where the applicant is not the inventor or not the sole inventor, the applicant is also to indicate how he or she acquired the right to the patent. The accuracy of the statements made is not verified by the German Patent and Trade Mark Office."

²⁶⁶ DPMA, decision of 24.03.2020 (102019128120.2) at II.1.a).

²⁶⁷ BGH GRUR 71,210, 212 – *Wildverbißverhinderung*

²⁶⁸ DPMA, decision of 24.03.2020 (102019128120.2) at II.1.a) 2

²⁶⁹ See footnote 233. See also the response from Germany to Note C. 9141.

inventor.²⁷⁰ The court based its conclusion on the fact that Section 7(2) of the Patent Regulation does not contain an exhaustive list of declarations, which can be made by the applicant.²⁷¹ Thus, the additional declaration (“[...] who caused the artificial intelligence DABUS to generate the invention”) was permissible. Concerns about practical problems due to the length of the entry under the “designation of the inventor” were dismissed by the BPatG, as the DPMA has discretion with regard to the publication of the information contained in the field “inventor” on the patent application form.

164. Finally, the BPatG admitted an appeal on the legal question whether an AI system could be designated as an inventor within the meaning of Section 37(1) of the Patent Act, because it is a matter of fundamental significance, and a decision by the Federal Court of Justice (Bundesgerichtshof, BGH) is necessary to ensure coherent future adjudication in different courts.

165. In June 2024, the German Federal Court of Justice issued its decision in the appeal from the BPatG. In the decision the court held that only a natural person can be designated as inventor in a patent application according to Section 37 para 1 of the German Patent Act. The court further noted that a machine system consisting of hardware and software cannot be designated as an inventor even if the machine system has the functions of artificial intelligence. Moreover, the court further noted that for being designated as inventor of a technical teaching which has been found with the help of an artificial intelligence system, a human contribution that has substantially influenced the overall success is sufficient. It was also held that an inventor designation according to Section 37 para 1 of the German Patent Act is necessary also in cases in which a system of artificial intelligence has been used to find the technical teaching. Finally, the court noted that the inventor designation must be clear and coherent. Overall, the decision confirms that only a natural person can be designated as inventor according to Section 37 para 1 Germany Patent Act.²⁷²

India

166. Subsequent to the national phase entry of the PCT application, the Patent Office in India issued an Examination Report, dated October 26, 2021, for patent application number 202017019068, which named DABUS as an inventor. The Report stipulates that the application cannot be proceed to the formal and technical examination, because the true and first inventor of the invention indicated is artificial intelligence.²⁷³ It reasoned that DABUS is not a person as per Section 2 (Definitions and interpretation)²⁷⁴ and Section 6 (Persons entitled to apply for patents)²⁷⁵ of the Patent Act 1970, and a valid proof of right had not been submitted by the applicant. In addition, the Report points out other issues that are not in compliance with the substantive patentability requirements.

167. In responding to the Report, the applicant submitted amendments to the application, and reiterated that while DABUS is not a person, it is a sole true deviser of the invention that is required to be indicated by the applicant in its patent application in accordance with the Indian Patent Act. A pre-grant opposition against the application was submitted on October 27, 2022,

²⁷⁰ *Bundespatentgericht* (Federal Patent Court), decision of November 11, 2021 – 11 W (pat) 5/21; see translation of the decision in 71 GRUR International: Journal of European and International IP Law, 1189 (2022).

²⁷¹ Section 7(2) of the Patent Regulations provides a list of information that must be contained in the indication of the inventor on the prescribed form. The list includes the first name, surname and addresses of the inventors.

²⁷² See the response from Germany to Note C. 9260.

²⁷³ Examination Report re application no. 202017019068, section (7)(I)1.1.

²⁷⁴ Section 2(1)(y) reads: "true and first inventor" does not include either the first importer of an invention into India, or a person to whom an invention is first communicated from outside India.

²⁷⁵ Section 6(1) reads: Subject to the provisions contained in section 134, an application for a patent for an invention may be made by any of the following persons, that is to say,— (a) by any person claiming to be the true and first inventor of the invention; (b) by any person being the assignee of the person claiming to be the true and first inventor in respect of the right to make such an application; (c) by the legal representative of any deceased person who immediately before his death was entitled to make such an application.

based on the various grounds, including non-compliance with Section 6. In particular, the opponent argues that the “true and first inventor” must be a human inventor and a machine does not hold any legal rights that can be transferred to the applicant. It further notes that under circumstances where non-natural persons are covered, the Patent Act explicitly stipulates it as an exception, e.g., Section 2(1)(s) explicitly states that “person” includes the Government. Furthermore, the opponent submitted that the applicant merely discovered the subject matter by reviewing the result given by the AI machine, and decided to file a patent application.

Japan

168. The applicant lodged the national phase application in August 2020 and stated “DABUS, an artificial intelligence that autonomously invented this invention” in the “Name of Inventor” field required by Article 184 bis 5(1) of the Patent Act. However, the Commissioner of the Japan Patent Office ordered the applicant to correct the name to that of a natural person, stating that only natural persons could be listed as inventors. Since the applicant did not make this correction, the application was rejected in October 2021. In response, the applicant argued that the term “invention” as defined by the Patent Act include AI inventions, and added that the name of the inventor is not a required item in applications related to AI inventions. Therefore, they claimed that the disposition in question is unlawful, and filed a lawsuit seeking the cancellation of the disposition in March 2023.²⁷⁶

Court Decisions

169. The Tokyo District Court dismissed the plaintiff's claims in May 2024, reasoning that the term “inventor” as defined by Patent Act does not include AI, and is limited to natural persons, based on the following two points: (1) given that the “invention” defined in the Intellectual Property Basic Act is illustrated as something “that is produced through creative activities by human beings,” it can be interpreted that an invention is produced by a natural person; and (2) the term “inventor” as stipulated in Article 36 of the Patent Act inherently assumes that the inventor is a natural person. Furthermore, the term “person who has made an invention” in Article 29 of the same law can receive a patent for that invention, and since AI cannot be the subject of rights, it can be concluded that “the person who has made an invention” refers to a natural person.²⁷⁷

170. On appeal, in January 2025, the Intellectual Property High Court dismissed the appellant's claims, reasoning that it is appropriate to interpret that an “invention” eligible for a patent under Patent Act is limited to those for which a natural person is the inventor. Furthermore, the court held that the “right to obtain a patent” as stipulated in Patent Act arises only when a natural person is the inventor. There are no provisions that establish procedures for granting patents based on rights other than the “right to obtain a patent,” nor are there provisions that assume non-natural persons can be inventors for the purpose of granting patents. Therefore, it is appropriate to conclude that an “invention” eligible for a patent under Patent Act is limited to those for which a natural person is the inventor.²⁷⁸

New Zealand

171. The PCT application entered into the national phase in New Zealand on May 12, 2021. In January 2022, the Intellectual Property Office of New Zealand (IPONZ) rendered a decision that the application for grant of a patent by Dr Thaler was void, since the application did not identify a natural person (i.e., human) inventor. As no inventor had been identified, no entitlement to a patent can be derived.

²⁷⁶ See response from Japan to Note C. 9260.

²⁷⁷ See response from Japan to Note C. 9260.

²⁷⁸ See response from Japan to Note C. 9260.

172. Specifically, the Assistant Commissioner considered the application did not comply with Section 22(1) of the Patents Act, which provides that a patent for an invention may only be granted to a person who: (a) is the inventor; or (b) derives title to the invention from the inventor; or (c) is the personal representative of a deceased person mentioned in paragraph (a) or (b). In particular, IPONZ stated that “[t]he term “inventor” as used in and as in the scheme of the Patents Act 2013 (the Act) refers only to a natural person, an individual. That inventors [sic] fall within the class of natural human persons is intrinsic to the proper construction of the Act. If the legislators had intended to allow granting of patents in New Zealand for inventions devised solely by non-humans such as artificial intelligences, or life forms other than human beings they would have drafted the Act to accommodate these possibilities specifically and explicitly. They did not do so. It is not appropriate for the Commissioner to ignore this fact and decide a case as though they should have done so.”²⁷⁹

173. With respect to Section 5(1) of the Patents Act, which states that, in general, the term “inventor” means, in relation to an invention, the *actual deviser* of the invention (emphasis added), IPONZ stated that that definition was no more than a statement that for an individual to be an inventor, they must have contributed to actually devising the invention, as opposed to importing or communicating the invention into New Zealand.

Court decisions

174. The High Court of New Zealand, Wellington Registry dismissed the appeal in March, 2023, and confirmed the decision of the IPONZ that “the term “inventor”, as used in and as in the scheme of the Patents Act 2013 refers only to a natural person, an individual.” Thus, the artificial intelligence called DABUS could not be the actual deviser of the invention.²⁸⁰ The court ruling was mainly buttressed by the legislative history, including the New Zealand patent legislation from 1860 up to the Patent Act of 2013.²⁸¹

175. While acknowledging that Section 22(1) does not explicitly state that the inventor needs to be a person, the Court stated that the natural reading of that provision would suggest so.²⁸² In addition, the Court was of the opinion that Sections 9 and 177 to 193 would sit most easily with inventors who are persons.²⁸³ The Court also considered the question as to whether the 2013 amendments to the Patents Act, which removed the direct references to “persons” in the relevant provisions, had been intended by Parliament to open up the possibility of an AI being an inventor. On this point, it found that the Explanatory Note to the Bill on introduction indicated the purpose behind the amendment had been to prevent mere importers, who are not actual devisers of the invention, from qualifying as inventors.²⁸⁴ Consequently, the Court was of the opinion that effectively expanding the definition of inventor through statutory interpretation by courts was not appropriate.²⁸⁵

Republic of Korea

176. Subsequent to the national phase entry of the PCT application, the Korean Intellectual Property Office (KIPO) denied the patent application 1020207007394 on September 28, 2022, on the ground that an inventor must be a natural person.²⁸⁶ Artificial intelligence systems are

not fulfilling the requirements under the Patent Act of the Republic of Korea, since only a natural person is accepted as a valid inventor.²⁸⁷

Court decisions

177. In June 2023, the Seoul Administrative Court confirmed that KIPO was within its rights to request an amendment to the inventor section in the application based on Article 203(3) of the Patent Act of the Republic of Korea. Firstly, the plaintiff argued that KIPO's rejection of the application was not justified, because the application complied with the formality requirements under the PCT in the corresponding PCT application. The Court rejected the argument, stating that KIPO had the authority to conduct formality examination according to the Patent Act. Secondly, the Court confirmed that, according to the Patent Act, only natural persons can be listed as an inventor. Thirdly, the Court highlighted that in the current state of technology, there was no substantiated data supporting the existence of strong AI, which could independently make decisions and act without relying on algorithms or data developed or provided by humans. Fourthly, the Court held that the status of an inventor required legal capacity, which was granted, in principle, only to natural persons (Article 3, Civil Act), while a legal person has a limited legal capacity (Article 34). As AI did not fall under the category of a natural person nor a legal person under existing laws, it was not possible to attribute legal capacity to AI within the current legal framework.²⁸⁸

178. This decision was appealed to the Seoul High Court which in May 2024 confirmed the first instance court's decision to invalidate²⁸⁹ Dr. Thaler's application. Here, the court noted that it was obvious that inventor refers to a natural person, and that "it is beyond the limitations of legitimate legal interpretation to incorporate AI into the inventor under the regulations set forth in the Act, in view of AI's emergence and development, the current AI level, social perception of AI etc."²⁹⁰

South Africa

179. In July 2021, South Africa, without any substantive examination of the patent application, issued a patent in the DABUS case, listing "DABUS, The invention was autonomously generated by an artificial intelligence" as the inventor.²⁹¹

United Kingdom

180. In December 2019, the UKIPO refused to proceed with DABUS patent applications GB1816909.4 and GB1818161.0 due to a lack of the statutory requirements concerning inventorship and entitlement.²⁹² Specifically, UKIPO stated that there was a clear expectation that the "inventor" under Section 7 of the Patents Act and the person whom the applicant believed to be the inventor under Section 13 are a natural person. On the entitlement to a patent, the applicant argued that it acquired the right by virtue of ownership of the inventor (i.e., DABUS). The UKIPO however decided that even if DABUS were an inventor, no law allows for the transfer of ownership of the invention from the inventor to the owner, and that derivation of right through ownership of the inventor did not meet the requirements of Section 7(2).

²⁸⁷ See the response from the Republic of Korea to Note C. 9141.

²⁸⁸ See the summary of the judgement in English, available on <https://artificialinventor.com/patent-applications/>.

²⁸⁹ The term "invalidate" is used here because KIPO issued a requirement for amendment; when the applicant did not comply, the application was deemed withdrawn under the Korean Patent Act, and the court subsequently confirmed that the application no longer had any legal effect. Unlike a rejection which typically leaves an application pending for further response or appeal the application here ceased to exist as a pending right.

²⁹⁰ See the response from the Republic of Korea to Note C. 9260, Seoul High Court Case No. 2023NU52088 Appeal for revocation against invalidation of a patent application.

²⁹¹ Patent Journal of South Africa, July 2021, Vol. 54 No. 7, /3242, p. 255.

²⁹² UKIPO Decision: BL O/741/19.

Court decisions

181. The High Court of Justice Business and Property Courts of England and Wales Patents Court confirmed the UKIPO's decision that an AI cannot be considered inventor under the Patents Act of 1977,²⁹³ which was also confirmed in the appeal by the Court of Appeals (Civil Division)²⁹⁴. According to the Courts, the term "inventor" is construed as the "person" who is the actual deviser of the invention.²⁹⁵ The High Court also stated that the "court can only construe legislation and cannot itself legislate, no matter how great the policy need".

182. Furthermore, the High Court also put forward the argument that the concept of "inventive step" found in patent law restricts the term inventor to natural persons, because only they are capable of mental activity and coming up with something that is "not obvious to a person skilled in the art."²⁹⁶ This line of argument however was not followed by the Court of Appeals, pointing out that the "inventive step is a question answered by considering how a *notional* person skilled in the art would behave".²⁹⁷ The permission to appeal the decision rendered by the Court of Appeals was ordered on August 12, 2022.

183. An oral hearing in the Supreme Court of the United Kingdom was conducted on March 2, 2023, and the judgment was handed down on December 20, 2023.²⁹⁸ In the decision, the Supreme Court held that an inventor, for the purposes of the Patent Act 1977, must be a natural person. Furthermore, the court held that under the Act, ownership of an AI system does not confer a right for the owner to apply for or obtain a patent relating to inventions generated by that AI system.²⁹⁹

184. In parallel to these proceedings, a divisional was filed in 2022, with a statement that "the applicant identifies no person or persons whom he believes to be an inventor" which received an examiner objection. After the Supreme Court decision described above was released, Dr. Thaler filed a further "statement of inventorship and of right to grant of a patent" form listing himself as the inventor which received another examiner objection. The UKIPO was of the opinion that they had "clear evidence on file that Dr. Thaler has never believed he is the inventor of this application" and they could not accept this latest change of mind. Dr. Thaler appealed and the court noted that while the UKIPO does not normally investigate statements of inventorship this does not mean to say that the UKIPO is powerless to act where that indication is obviously defective or insufficient. Dr Thaler argued that his understanding of the law had shifted following the Supreme Court ruling, though his view of the underlying facts had not. Yet this did not appear to alter his position on who he regarded as the "actual deviser" of the invention. Separately, the court held that the earlier (parent) application is treated as having deemed withdrawn on 17 June 2021 - the day after the deadline to name the inventor expired - so the 2022 filing could not validly take divisional status or rely on the earlier filing date. Therefore, the court dismissed his appeal.³⁰⁰

United States of America

185. In its decision in April 2020,³⁰¹ the USPTO was of the opinion that the definition of an inventor in 35 U.S.C. § 100 (f) ("the individual or, if a joint invention, the individuals collectively who invented or discovered the subject matter of the invention") demanded a natural person to be an inventor. According to the USPTO, the wording of 35 U.S.C §101 "Whoever invents or

³⁰¹ Decision on Petition: In Re Application No. 16/524,350.

discovers any new and useful (...)” indicated that an inventor must be a natural person.³⁰² Further, the USPTO referred to case law,³⁰³ such as *Univ. of Utah v. Max-Planck-Gesellschaft zur Förderung der Wissenschaften e.V.*, according to which the Federal Circuit had established that a state could not be an inventor, because in order to perform the mental act of conception, inventors must be natural persons and cannot be corporations or sovereigns.³⁰⁴

Court decisions

186. The United States District Court for the Eastern District of Virginia³⁰⁵ in 2021, and the United States Court of Appeals for the Federal Circuit (CAFC)³⁰⁶ in 2022 confirmed the decision of the USPTO.

187. Both courts denied the possibility for an AI to be an inventor and held that the Patent Act requires an inventor to be a natural person. The decisions are in line with the consistent earlier holdings of the CAFC, albeit decided without any connection to AI, that only natural persons can be inventors.³⁰⁷

188. In its 2022 ruling, the CAFC based its decision on the provisions in 35 U.S.C., which expressly provide that inventors are individuals (35 U.S.C. § 100(f)³⁰⁸ and (g), and § 115). Even though the US Patent Act itself does not further define the term “individual”, the court argued that it must be read as a “human being, a person”, following the United States Supreme Court decision in *Mohamad v. Palestinian Auth.*,³⁰⁹ because “nothing in the Patent Act indicates that Congress intended to deviate from the default meaning”.³¹⁰ The court further pointed out that the use of personal pronouns (“herself”, “himself”) in the Patent Act as well as the required statements in the form of an inventor’s oath or declaration in § 115(b) of the Patent Act. Thus, the CAFC rejected the notion that the Patent Act is open to other reasonable readings with regard to the term “inventor”. Accordingly, it did not pursue any other forms of statutory construction. Policy arguments regarding the encouragement of innovation and public disclosure through the possibility to designate an AI as inventor on the patent application form, as submitted by the patent applicant, were dismissed by the court as speculative and unfounded. The court further explained that it was not confronted with “the question of whether inventions made by human beings with the assistance of AI are eligible for patent protection.”³¹¹

189. The Supreme Court of the United States of America denied a petition for a *writ of certiorari* on April 24, 2023.³¹²

European Patent Office (EPO)

190. In November 2019, the EPO Receiving Section refused the two patent applications, EP 18275163 and EP 18275174, designating DABUS as an inventor. The main reasons for its decisions are:

- Only a human inventor can be an inventor in the meaning of the EPC and meet the formal requirements under the EPC Article 81³¹³ and Rule 19(1)³¹⁴ regarding the designation of the inventor.

The legislative history of the EPC consistently refer to the inventor as being a natural person. Furthermore, names given to natural persons serve not only the function of identifying them, but also enable them to exercise their rights and form part of their personality.

- Since an AI has no legal personality, the requirements of EPC Articles 60(1)³¹⁵ and 81 are not met, since an AI can be neither employed nor can they transfer any rights to a successor in title.

AI systems or machines have at present no rights because they have no legal personality comparable to natural or legal persons. Legal personality of non-natural persons is based on legal fictions, either created by legislation or developed through consistent jurisprudence.

191. The applicant filed appeals against these decisions, which were reviewed by the Legal Board of Appeal of the European Patent Office in cases J 8/20 and J 9/20 (see below, under “Legal Board of Appeal”).

192. On December 20, 2021, the applicant filed a divisional application (EP 21216024), dividing EP 18275163, which was covered by case J 8/20.³¹⁶ The Examination Division, in its report dated March 14, 2023, rendered the preliminary opinion on, *inter alia*, the issues raised in the main and auxiliary requests, concluding that the application does not meet the requirements concerning the designation of an inventor. In its main request dated August 22, 2022, the applicant made a statement, instead of designating the inventor, that the applicant was not able to identify an inventor and that the applicant who owned DABUS had the right to a patent. On this point, the Examination Division maintained that the applicant had not submitted a statement of origin of the right and therefore does not comply with EPC Article 81. As a new auxiliary request dated August 22, 2022, in a Designation of inventor form, the applicant designated as inventor “Stephen L. Thaler by virtue of being the owner of the AI system (DABUS) that created the invention disclosed in the application”. Additionally, the applicant introduced the following statement in the description: “The applicant has identified Dr. Stephen L Thaler as the deemed inventor by virtue of Dr Thaler being the owner of the artificial intelligence machine DABUS [...]. The invention disclosed herein was created autonomously by DABUS and is an AI-generated invention [...]”. The Examination Division stated that the auxiliary request did not meet the requirements of Article 81, as it did not clearly and unambiguously designate an inventor. It also noted that the above statement introduced in the description was irrelevant to the understanding of the invention, and should therefore be deleted.

³¹³ Article 81 reads: The European patent application shall designate the inventor. If the applicant is not the inventor or is not the sole inventor, the designation shall contain a statement indicating the origin of the right to the European patent.

³¹⁴ Rule 19(1) states: The request for grant of a European patent shall contain the designation of the inventor. However, if the applicant is not the inventor or is not the sole inventor, the designation shall be filed in a separate document. The designation shall state the family name, given names and country and place of residence of the inventor, contain the statement referred to in Article 81 and bear the signature of the applicant or his representative.

³¹⁵ Article 60(1) states: The right to a European patent shall belong to the inventor or his successor in title. If the inventor is an employee, the right to a European patent shall be determined in accordance with the law of the State in which the employee is mainly employed; if the State in which the employee is mainly employed cannot be determined, the law to be applied shall be that of the State in which the employer has the place of business to which the employee is attached.

³¹⁶ EPO Board of Appeal, Case J 8/20, decision of December 21, 2021, ECLI:EP:BA:2021:J000820.20211221 – Designation of inventor/DABUS.

193. With the decision dated 25 November 2024, patent application EP 21216024 was refused by the Examining Division because none of the designations of inventor on file, according to the Main Request as well as the first and second Auxiliary Requests met the requirements of Article 81, Rule 19 and Article 60(1) EPC.³¹⁷

194. In the Main Request, the applicant Mr. Stephen L. Thaler, designated himself as the inventor in Form 1002 and filed an Addendum stating that the invention was conceived autonomously by the machine DABUS and that Mr. Thaler was not an inventor under the “traditional criteria”. Additionally, the applicant filed an amended description containing a preamble stating that the invention disclosed in the application was an AI-generated invention, which was conceived autonomously by the artificial intelligence machine DABUS. The Examining Division concluded that the Addendum and the amended description contradicted the statement filed in Form 1002. Since the patent application must meet the EPC requirements as a whole (Article 97 EPC), this contradiction made the designation of inventor unclear, and did not allow to establish who was designated as inventor.³¹⁸

195. Both auxiliary requests were refused for the same reasons. The designation of inventor according to the first and second auxiliary requests indicated Mr. Stephen L. Thaler as inventor and comprised a modified Addendum which stated that “Dr Thaler had caused [...] DABUS to conceive of the invention....” The Examining Division concluded that the statement that DABUS conceived of the invention amounted to unambiguously stating that DABUS was the inventor and was in contradiction with the designation of Mr Thaler as inventor in Form 1002.³¹⁹

196. An appeal is pending. On 24 January 2025, the applicant filed a notice of appeal. The grounds of appeal may be filed until 25 March 2025.³²⁰

197. The Legal Board of Appeal of the EPO (Board of Appeal) dealt with the designation of an AI inventor in its decisions J 8/20 (appeal against the refusal of application No.18275163) and J 9/20 (appeal against refusal of application No. 18275174), dated December 21, 2021. It rejected the notion that an AI could be designated as an inventor in the context of the EPC.³²¹ Instead, the Board of Appeal argued that, under Article 81 EPC, the designated inventor has to be a person with legal capacity. This can be inferred, without the necessity to refer to the *travaux préparatoires* of the EPC, from the plain meaning of the word “inventor”.³²² Further support was found in the purpose of the provision, which aims at protecting the rights of the inventor. Namely, the Board of Appeal specifies that the purpose of Article 81 EPC and the related provisions in the Regulations is “primarily to confer and to protect rights of the inventor [...], to facilitate the enforcement of potential compensation claims provided under domestic law, and to identify a legal basis for entitlement to the application.”³²³ As an AI does not enjoy rights, it can thus not be designated as an inventor under the EPC.³²⁴

198. The Board of Appeal further clarified that a transfer of the patent right from an AI to a natural person is not possible because an AI as such does not own any rights and has no legal personality. In this context, a mere designation of ownership over the AI does not bring the owner in the scope of Article 60(1) EPC, i.e. the owner cannot automatically be considered as a

³²² EPO Board of Appeal, Case J 8/20, decision of December 21, 2021, ECLI:EP:BA:2021:J000820.20211221 – Designation of inventor/DABUS, section 4.3.2 and 4.3.3.

³²³ *Ibid.*, section 4.3.3.

³²⁴ *Ibid.*, section 4.3.3.

“successor in title” because no transaction regarding the patent right occurred in the first place.³²⁵

199. Regarding the broader question as to whether inventions made by AI are generally patentable, the Board of Appeal agreed that the scope of EPC Article 52(1) regarding patentable inventions was not limited to inventions conceived by humans.³²⁶ Therefore, the Board of Appeal clarified that *how* an invention had been made played no role under the EPC.³²⁷ However, the Board of Appeal believed that the broad wording of Article 52(1) cannot override the formal requirement of the EPC with regard to the designation of a person with legal capacity as an inventor.³²⁸

VII. CONCEPT OF INVENTORSHIP IN RELATION TO AI INVENTIONS

A. OVERVIEW OF THEORIES RELATING TO PATENT PROTECTION OF AI INVENTIONS

200. Although it is generally believed that AI technology has not reached to the point where AI systems can autonomously create inventions, some scholars have advanced their thoughts on whether inventions created by AI should be protected under patent law, and if so, how it should be framed. This subchapter provides a non-exhaustive overview of theories relating to patent protection of inventions created by AI.

201. Some argue that the law should recognize AI inventorship or, at least, co-inventorship for the purposes of patent law, as it would encourage innovation through increased research and investment in AI systems.³²⁹ This line of argumentation follows the classic patent incentive theory, albeit not in connection with the AI systems themselves (which do not need incentives to be productive³³⁰) but rather with the people developing and maintaining those machines. Further questions could be asked with regard to indirect incentives for the companies that are investing in AI systems and are profiting from the output of their AIs.

202. A justification of AI inventorship based on the natural rights theory, for instance in the line of thought of Hegel,³³¹ is rarely advocated for, as it is harder to reconcile with the very nature of AI systems, unless one would recognize them as legal persons.³³² Ultimately, the debate over legal personhood of AI systems is the crux of the whole matter – not only regarding AI and IP but AI and the law in general, as some judges suggested in their DABUS decisions. As AI systems are supporting, and in fact substituting, more and more activities traditionally carried

³³¹ Hegel argues that property rights are used for realizing the personality of humans, see Georg W.F. Hegel, *Grundlinien der Philosophie des Rechts* (Elements of the Philosophy of Right), 1821. Thus, “[...] an idea belongs to its creator because the idea is a manifestation of the creator’s personality”, see Justin Hughes, *The Philosophy of Intellectual Property*, 77 *Geo. L.J.* 287, 330 (1988).

³³² Brown, *Property ownership and the legal personhood of artificial intelligence*, 30 *Information & Communications Technology Law* 208-234 (2021) (arguing that weak AI, but not strong AI, may be granted legal personhood); Mark Fenwick & Stefan Wrba, *AI and Legal Personhood*, in *The Cambridge Handbook of Artificial Intelligence: Global Perspectives on Law and Ethics* p. 288-303 (Larry DiMatteo, Cristina Poncibò et al., eds, 2022) (supporting the exploration of personhood for AI in cases of harm caused by them); Visa Kurki, *A Theory of Legal Personhood*, p. 175-190 (2019) (arguing that strong AI may have legal personhood regardless of whether those AIs are worthy of moral consideration); Eliza Mik, *AI as a Legal Person?*, in *Artificial Intelligence and Intellectual Property* p. 419-439 (Jyh- An Lee & Reto M. Hilty eds., 2021) (arguing that there is no purpose or benefit of granting personhood to an AI in the context of IP law).

out by humans, such as driving, the question of rights (as well as responsibilities, e.g. for wrongdoing) become more pressing. These issues are broadly discussed³³³ but legal personhood for AI systems are generally seen with skepticism.³³⁴

203. Some argue that AI inventions pose challenges to the justification theory of patents that relies on the promotion of disclosure of (new) information through the patent system. Some argue that this justification does not apply to inventions created by AI because “[...] the inner workings and the use of AI in the inventive process are not properly understood or are largely unknown.”³³⁵ “While patent law’s enablement doctrine focuses on the particular result of the invention process, some argue that AI presents a lack of transparency and difficulty in replication that profoundly and fundamentally challenges the disclosure theory in patent law.”³³⁶ However, it may be not adequate to discuss this issue in a generalized manner, since the sufficiency of disclosure under patent law involves various factors, such as the scope of the claims and the person skilled in the art. The sufficiency of disclosure requirement has also been applied to those inventions that the reproduction of their exact copies is not practicable (e.g., biological variability of reproduced material).

204. Some scholars hold the view that acknowledging AI inventorship would prevent the wrongful or dishonest claim to AI-created inventions by humans, and at the same time, it provides better recognition of human inventors who created the invention on their own.³³⁷

205. Other scholars are agreeing with the notion that AI inventorship does exist, as these AI systems are perceived as the true and only inventors of AI-generated inventions. At the same time, these scholars are not persuaded that the inventorship should lead to ownership – i.e., a protection of the invention through exclusive rights – but rather they see the invention as part of the public domain.³³⁸ Some, however, argued that it may lead to the so-called tragedy of the anticommons and its detrimental effects on innovation.³³⁹ Furthermore, the lack of flexibility regarding the allocation of rewards is seen as inefficient for AI systems, as there are multiple parties involved with different degrees of contributions to the invention.³⁴⁰ Also, patent protection might, especially in the case of an exponential growth of AI-generated inventions, impede follow-on invention through a steep increase of transaction costs for developing cumulative innovation.³⁴¹

206. If one accepts the premise that AI systems can be considered inventors according to patent law standards, and thus can be more than mere tools in the invention process, the legal doctrines of joint inventorship or employee inventors in patent law are seen by some as possibly applicable.³⁴² Whether joint inventorship or the rules regarding employee inventions apply would be mainly a question of how the human-AI relationship will be perceived. In a relationship among equal innovators, joint inventorship might prevail. Conversely, if the

relationship would be in the nature of a sponsor-inventor relationship with *quasi* mutual dependency, the employee invention rules might be used as a model. Either way, the lack of personhood, or of legal capacity of AI systems, does not seem to fit to the existing legal frameworks.³⁴³

B. POTENTIAL INTERSECTIONS BETWEEN INVENTORSHIP AND AI

207. The DABUS applications are so far the only concrete case of an AI system being claimed as an inventor. In that case, national/regional patent offices predominantly looked at the question as to whether indicating the AI system as an inventor on a patent application meets the formality requirement under the applicable law. Extended analysis carried out by some patent offices and courts, however, show that the question can touch upon many fundamental issues that have been the cornerstones of the modern patent law. These include:

- (i) the inventor's right to a patent (in principle), which may be assigned to a successor in title (issues relating to the lack of legal capacity of AI systems, establishment of a chain of title and ownership, compliance with the formality requirements, including declarations or statements on inventorship and the applicant's entitlement to a patent);
- (ii) moral rights of inventors (the rationale behind the moral rights of inventors and naming the inventor, and indication of the name of the inventors in a patent application);
- (iii) definition and interpretation of the terms "inventor" and "joint inventor" (the notion of "inventions" under patent law and an inventor being an originator of the invention, whether an inventor shall be a natural person, and qualification and determination of an "inventor" and a "joint inventor");
- (iv) inaccurate designation of an inventor, including usurpation (mechanisms to correct inaccurate designation of an inventor, legal consequences of non-submission or inaccurate designation of an inventor, including the cases where inventorship is falsely claimed by a third party, and possible remedies in case of usurpation).

While information about employee invention models under various national laws are also collected in this document, as described above, the lack of legal personality of AI systems would be a significant hurdle for applying these models.

208. The legal frameworks addressing these issues are naturally led by the rationale and policy objectives of the patent system which are commonly described as promoting inventive activities and transfer of technology by setting a mechanism for providing incentives to innovate, protecting inventions and facilitating dissemination of new technological information and technologies. The policy and legal analysis of these intertwined issues in the context of the AI is beyond the scope of this paper. However, the compilation of the national/regional law and decisions of patent offices and courts point more to certain issues than others, as indicated in the previous paragraph.

209. As stated in Chapter II, interaction between a human and an AI system during the invention process may take different forms. In other words, contribution to the invention process may vary greatly, whether it is made by a human or by an AI system. This comes with very different results from a patent law assessment perspective, depending on what role the AI system plays in it and how that system was created, trained and used. That could be a reason why discussions on AI inventorship have already been started, even if humans continue to participate in the invention process.

³⁴³ See the response from Colombia to Note C. 9141.

210. For example, multiple persons may be involved in the creation of inventions using AI. One person may have identified a technical problem to be solved and have an idea of using AI to find a solution. Another person may have developed or trained the AI model, such as designing an AI algorithm, generating and selecting data for training the AI model. In addition, there may have been another person who is a user of the trained AI model to find a solution to the identified problem. Yet, another person may have been involved for analyzing and verifying the AI output. Even if that does not involve a question as to whether an AI machine can be an inventor by itself, the question of who an inventor is, or who can be deemed joint inventors, needs to be determined, based on the circumstances of each case.

211. In addition, considering the impressive advancement of machine learning technologies, an AI system, even if it is not autonomous, might demonstrate substantive contribution at a much higher level to the invention creation process in future. As a potential scenario, although sufficient contribution to the conception of the invention is made by a human inventor, an AI system might also contribute to the invention at the level where, if it were a human, it could qualify as a joint inventor.

212. Some countries have started stakeholder consultations that address the issues around intellectual property and AI, including questions relating to inventorship. For example, the government of the United Kingdom sought evidence and views on a range of options relating to, *inter alia*, patent protection for AI-devised inventions.³⁴⁴ The government issued a consultation outcome paper entitled “Artificial Intelligence and Intellectual Property: Copyright and Patents: Government response to consultation”.³⁴⁵

213. The USPTO launched a request for public comments regarding artificial intelligence and inventorship,³⁴⁶ which contains a number of questions relating to the current state of AI technologies, contribution to the conception of an invention by non-humans and joint inventorship, ownership issues, and future directions on the matters relating to inventorship. It also organized Listening Sessions on these issues, during which the USPTO presented hypothetical cases.³⁴⁷
